CONTENTS

SOLVED PAPER
NEET 2016

Phase - I held on 1st May

Motion in a Straight Line

1. If the velocity of a particle is $v = At + Bt^2$, where A and B are constants, then the distance travelled by it between 1 s and 2 s is
(a) $\frac{3}{2}A + \frac{7}{3}B$ (b) $\frac{A}{2} + \frac{B}{3}$
(c) $\frac{3}{2}A + 4B$ (d) $3A + 7B$

Motion in a Plane

2. If the magnitude of sum of two vectors is equal to the magnitude of difference of the two vectors, the angle between these vectors is
(a) 45° (b) 180° (c) 0° (d) 90°

3. A particle moves so that its position vector is given by $\vec{r} = \cos\omega t\,\hat{x} + \sin\omega t\,\hat{y}$, where ω is a constant.
Which of the following is true?
(a) Velocity of perpendicular to $\vec{r}$ and acceleration is directed towards the origin.
(b) Velocity is perpendicular to $\vec{r}$ and acceleration is directed away from the origin.
(c) Velocity and acceleration both are perpendicular to $\vec{r}$.
(d) Velocity and acceleration both are parallel to $\vec{r}$.

Laws of Motion

4. A car is negotiating a curved road of radius R. The road is banked at an angle θ. The coefficient of friction between the tyres of the car and the road is μ_s. The maximum safe velocity on this road is
(a) $\sqrt{\frac{g}{R}\frac{\mu_s + \tan\theta}{1 - \mu_s \tan\theta}}$ (b) $\sqrt{\frac{g}{R^2}\frac{\mu_s + \tan\theta}{1 - \mu_s \tan\theta}}$
(c) $\sqrt{gR^2\frac{\mu_s + \tan\theta}{1 - \mu_s \tan\theta}}$ (d) $\sqrt{gR\frac{\mu_s + \tan\theta}{1 - \mu_s \tan\theta}}$

Work, Energy and Power

5. A particle of mass 10 g moves along a circle of radius 6.4 cm with a constant tangential acceleration. What is the magnitude of this acceleration if the kinetic energy of the particle becomes equal to 8×10^{-4} J by the end of the second revolution after the beginning of the motion?
(a) 0.18 m/s^2 (b) 0.2 m/s^2
(c) 0.1 m/s^2 (d) 0.15 m/s^2

6. A body of mass 1 kg begins to move under the action of a time dependent force $\vec{F} = (2t\,\hat{i} + 3t^2\,\hat{j})$N, where $\hat{i}$ and $\hat{j}$ are unit vectors along x and y axis. What power will be developed by the force at the time t?
(a) $(2t^3 + 3t^4)$ W (b) $(2t^3 + 3t^5)$ W
(c) $(2t^2 + 3t^3)$ W (d) $(2t^2 + 4t^4)$ W

7. What is the minimum velocity with which a body of mass m must enter a vertical loop of radius R so that it can complete the loop?
(a) $\sqrt{3gR}$ (b) $\sqrt{5gR}$ (c) $\sqrt{gR}$ (d) $\sqrt{2gR}$

System of Particles and Rotational Motion

8. A disk and a sphere of same radius but different masses roll off on two inclined planes of the same altitude and length. Which one of the two objects gets to the bottom of the plane first?
(a) Both reach at the same time
(b) Depends on their masses
(c) Disk
(d) Sphere

9. From a disc of radius R and mass M, a circular hole of diameter R, whose rim passes through the centre is cut. What is the moment of inertia of the remaining part of the disc about a perpendicular axis, passing through the centre?
(a) $11\,MR^2/32$ (b) $9\,MR^2/32$
(c) $15\,MR^2/32$ (d) $13\,MR^2/32$

10. A uniform circular disc of radius 50 cm at rest is free to turn about an axis which is perpendicular to its plane and passes through its centre. It is subjected to a torque which produces a constant angular acceleration of 2.0 rad s^{-2}. Its net acceleration in m s^{-2} at the end of 2.0 s is approximately
(a) 6.0 (b) 3.0 (c) 8.0 (d) 7.0

Gravitation

11. At what height from the surface of earth the gravitation potential and the value of g are -5.4×10^{7} J kg^{-2} and 6.0 m s^{-2} respectively? Take the radius of earth as 6400 km.
(a) 1400 km (b) 2000 km
(c) 2600 km (d) 1600 km

12. The ratio of escape velocity at earth (v_e) to the escape velocity at a planet (v_p) whose radius and mean density are twice as that of earth is
(a) 1 : 4 (b) $1:\sqrt{2}$
(c) 1 : 2 (d) $1:2\sqrt{2}$

Properties of Matter

13. Coefficient of linear expansion of brass and steel rods are α_1 and α_2. Lengths of brass and steel rods are l_1 and l_2 respectively. If $(l_2 - l_1)$ is maintained same at all temperatures, which one of the following relations holds good?
(a) $\alpha_1^2 l_2 = \alpha_2^2 l_1$ (b) $\alpha_1 l_1 = \alpha_2 l_2$
(c) $\alpha_1 l_2 = \alpha_2 l_1$ (d) $\alpha_1 l_2^2 = \alpha_2 l_1^2$

14. A piece of ice falls from a height h so that it melts completely. Only one-quarter of the heat produced is absorbed by the ice and all energy of ice gets converted into heat during its fall. The value of h is [Latent heat of ice is 3.4×10^5 J/ kg and $g = 10$ N/kg]
(a) 136 km (b) 68 km
(c) 34 km (d) 544 km

15. A black body is at a temperature of 5760 K. The energy of radiation emitted by the body at wavelength 250 nm is U_1, at wavelength 500 nm is U_2 and that at 1000 nm is U_3. Wien's constant, $b = 2.88 \times 10^6$ nmK. Which of the following is correct?
(a) $U_1 > U_2$ (b) $U_2 > U_1$
(c) $U_1 = 0$ (d) $U_3 = 0$

16. Two non-mixing liquids of densities ρ and $n\rho$ $(n > 1)$ are put in a container. The height of each liquid is h. A solid cylinder of length L and density d is put in this container. The cylinder floats with its axis vertical and length pL $(p < 1)$ in the denser liquid. The density d is equal to
(a) $\{2 + (n - 1)p\}\rho$ (b) $\{1 + (n - 1)p\}\rho$
(c) $\{1 + (n + 1)p\}\rho$ (d) $\{2 + (n + 1)p\}\rho$

Thermodynamics and Kinetic Theory

17. A gas is compressed isothermally to half its initial volume. The same gas is compressed separately through an adiabatic process until its volume is again reduced to half. Then
(a) Compressing the gas isothermally or adiabatically will require the same amount of work.
(b) Which of the case (whether compression through isothermal or through adiabatic process) requires more work will depend upon the atomicity of the gas.
(c) Compressing the gas isothermally will require more work to be done.
(d) Compressing the gas through adiabatic process will require more work to be done.

18. The molecules of a given mass of a gas have r.m.s. velocity of 200 m s^{-1} at 27°C and 1.0×10^5 N m^{-2} pressure. When the temperature and pressure of the gas are respectively, 127°C and 0.05×10^5 N m^{-2}, the r.m.s. velocity of its molecules in m s^{-1} is
(a) $\frac{100\sqrt{2}}{3}$ (b) $\frac{100}{3}$
(c) $100\sqrt{2}$ (d) $\frac{400}{\sqrt{3}}$

19. A refrigerator works between 4°C and 30°C. It is required to remove 600 calories of heat every second in order to keep the temperature of the refrigerated space constant. The power required is (Take 1 cal = 4.2 Joules)
(a) 236.5 W (b) 2365 W
(c) 2.365 W (d) 23.65 W

Waves

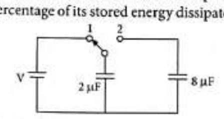
20. A siren emitting a sound of frequency 800 Hz moves away from an observer towards a cliff at a speed of 15 m s^{-1}. Then, the frequency of sound that the observer hears in the echo reflected from the cliff is
(Take velocity of sound in air = 330 m s^{-1})
(a) 838 Hz (b) 885 Hz
(c) 765 Hz (d) 800 Hz

21. An air column, closed at one end and open at the other, resonates with a tuning fork when the smallest length of the column is 50 cm. The next larger length of the column resonating with the same tuning fork is
(a) 150 cm (b) 200 cm
(c) 66.7 cm (d) 100 cm

22. A uniform rope of length L and mass m_1 hangs vertically from a rigid support. A block of mass m_2 is attached to the free end of the rope. A transverse pulse of wavelength λ_1 is produced at the lower end of the rope. The wavelength of the pulse when it reaches the top of the rope is λ_2. The ratio λ_2/λ_1 is
(a) $\sqrt{\frac{m_2}{m_1}}$ (b) $\sqrt{\frac{m_1 + m_2}{m_1}}$
(c) $\sqrt{\frac{m_1}{m_2}}$ (d) $\sqrt{\frac{m_1 + m_2}{m_2}}$

Electrostatics

23. A capacitor of 2 μF is charged as shown in the diagram. When the switch S is turned to position 2, the percentage of its stored energy dissipated is



(a) 75% (b) 80% (c) 0% (d) 20%

24. Two identical charged spheres suspended from a common point by two massless strings of lengths l, are initially at a distance d $(d << l)$ apart because of their mutual repulsion. The charges begin to leak from both the spheres at a constant rate. As a result, the spheres approach each other with a velocity v. Then v varies as a function of the distance x between the spheres, as
(a) $v \propto x^{-1/2}$ (b) $v \propto x^{-1}$
(c) $v \propto x^{1/2}$ (d) $v \propto x$

Current Electricity

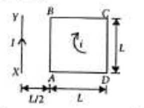
25. A potentiometer wire is 100 cm long and a constant potential difference is maintained across it. Two cells are connected in series first to support one another and then in opposite direction. The balance points are obtained at 50 cm and 10 cm from the positive end of the wire in the two cases. The ratio of emf's is
(a) 3 : 4 (b) 3 : 2 (c) 5 : 1 (d) 5 : 4

26. The charge flowing through a resistance R varies with time t as $Q = at - bt^2$, where a and b are positive constants. The total heat produced in R is
(a) $\frac{a^3R}{2b}$ (b) $\frac{a^3R}{b}$ (c) $\frac{a^3R}{6b}$ (d) $\frac{a^3R}{3b}$

Moving Charges and Magnetism

27. A long straight wire of radius a carries a steady current I. The current is uniformly distributed over its cross-section. The ratio of the magnetic fields B and B', at radial distances $\frac{a}{2}$ and $2a$ respectively, from the axis of the wire is
(a) 1 (b) 4 (c) $\frac{1}{4}$ (d) $\frac{1}{2}$

28. A square loop $ABCD$ carrying a current i, is placed near and coplanar with a long straight conductor XY carrying a current I, the net force on the loop will be



(a) $\frac{2\mu_0 IiL}{3\pi}$ (b) $\frac{\mu_0 IiL}{2\pi}$
(c) $\frac{2\mu_0 Ii}{3\pi}$ (d) $\frac{\mu_0 Ii}{2\pi}$

Magnetism and Matter

29. The magnetic susceptibility is negative for
(a) ferromagnetic material only
(b) paramagnetic and ferromagnetic materials
(c) diamagnetic material only
(d) paramagnetic material only

Electromagnetic Induction and Alternating Current

30. An inductor 20 mH, a capacitor 50 μF and a resistor 40 Ω are connected in series across a source of emf $V = 10 \sin 340t$. The power loss in A.C. circuit is
(a) 0.76 W
(b) 0.89 W
(c) 0.51 W
(d) 0.67 W

31. A small signal voltage $V(t) = V_0 \sin\omega t$ is applied across an ideal capacitor C
(a) Current $I(t)$ is in phase with voltage $V(t)$.
(b) Current $I(t)$ leads voltage $V(t)$ by 180°.
(c) Current $I(t)$, lags voltage $V(t)$ by 90°.
(d) Over a full cycle the capacitor C does not consume any energy from the voltage source.

32. A long solenoid has 1000 turns. When a current of 4 A flows through it, the magnetic flux linked with each turn of the solenoid is 4×10^{-3} Wb. The self-inductance of the solenoid is
(a) 2 H (b) 1 H
(c) 4 H (d) 3 H

Electromagnetic Waves

33. Out of the following options which one can be used to produce a propagating electromagnetic wave?
(a) A chargeless particle
(b) An accelerating charge
(c) A charge moving at constant velocity
(d) A stationary charge

Optics

34. Match the corresponding entries of **column 1** with **column 2**. [Where m is the magnification produced by the mirror]

Column 1	Column 2
(A) $m = -2$	(p) Convex mirror
(B) $m = -\frac{1}{2}$	(q) Concave mirror
(C) $m = +2$	(r) Real image
(D) $m = +\frac{1}{2}$	(s) Virtual image

(a) A → p and s; B → q and r; C → q and s; D → q and r
(b) A → r and s; B → q and s; C → q and r; D → p and s
(c) A → q and r; B → q and r; C → q and s; D → p and s
(d) A → p and r; B → p and s; C → p and q; D → r and s

35. In a diffraction pattern due to a single slit of width a, the first minimum is observed at an angle 30° when light of wavelength 5000 Å is incident on the slit. The first secondary maximum is observed at an angle of
(a) $\sin^{-1}\left(\frac{1}{2}\right)$ (b) $\sin^{-1}\left(\frac{3}{4}\right)$
(c) $\sin^{-1}\left(\frac{1}{4}\right)$ (d) $\sin^{-1}\left(\frac{2}{3}\right)$

36. The intensity at the maximum in a Young's double slit experiment is I_0. Distance between two slits is $d = 5\lambda$, where λ is the wavelength of light used in the experiment. What will be the intensity in front of one of the slits on the screen placed at a distance $D = 10d$?
(a) $\frac{3}{4} I_0$ (b) $\frac{I_0}{2}$ (c) I_0 (d) $\frac{I_0}{4}$

37. A astronomical telescope has objective and eyepiece of focal lengths 40 cm and 4 cm respectively. To view an object 200 cm away from the objective, the lenses must be separated by a distance
(a) 50.0 cm (b) 54.0 cm
(c) 37.3 cm (d) 46.0 cm

38. The angle of incidence for a ray of light at a refracting surface of a prism is 45°. The angle of prism is 60°. If the ray suffers minimum deviation through the prism, the angle of minimum deviation and refractive index of the material of the prism respectively, are
(a) $45°; \sqrt{2}$ (b) $30°; \frac{1}{\sqrt{2}}$
(c) $45°; \frac{1}{\sqrt{2}}$ (d) $30°; \sqrt{2}$

Dual Nature of Radiation and Matter

39. An electron of mass m and a photon have same energy E. The ratio of de-Broglie wavelengths associated with them is
(a) $c(2mE)^{\frac{1}{2}}$ (b) $\frac{1}{c}\left(\frac{2m}{E}\right)^{\frac{1}{2}}$
(c) $\frac{1}{c}\left(\frac{E}{2m}\right)^{\frac{1}{2}}$ (d) $\left(\frac{E}{2m}\right)^{\frac{1}{2}}$
(c being velocity of light)

40. When a metallic surface is illuminated with radiation of wavelength λ, the stopping potential is V. If the same surface is illuminated with radiation of wavelength 2λ, the stopping potential is $\frac{V}{4}$. The threshold wavelength for the metallic surface is
(a) $\frac{5}{2}\lambda$ (b) 3λ (c) 4λ (d) 5λ

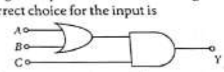
Atoms and Nuclei

41. Given the value of Rydberg constant is 10^7 m^{-1}, the wave number of the last line of the Balmer series in hydrogen spectrum will be
(a) $0.25 \times 10^7 \text{ m}^{-1}$ (b) $2.5 \times 10^7 \text{ m}^{-1}$
(c) $0.025 \times 10^4 \text{ m}^{-1}$ (d) $0.5 \times 10^7 \text{ m}^{-1}$

42. When an α-particle of mass m moving with velocity v bombards on a heavy nucleus of charge Ze, its distance of closest approach from the nucleus depends on m as
(a) $\frac{1}{m^2}$ (b) m (c) $\frac{1}{m}$ (d) $\frac{1}{\sqrt{m}}$

Semiconductor Electronics : Materials, Devices and Simple Circuits

43. To get output 1 for the following circuit, the correct choice for the input is



(a) $A = 1, B = 1, C = 0$ (b) $A = 1, B = 0, C = 1$
(c) $A = 0, B = 1, C = 0$ (d) $A = 1, B = 0, C = 0$

44. A npn transistor is connected in common emitter configuration in a given amplifier. A load resistance of 800 Ω is connected in the collector circuit and the voltage drop across it is 0.8 V. If the current amplification factor is 0.96 and the input resistance of the circuit is 192 Ω, the voltage gain and the power gain of the amplifier will respectively be
(a) 4, 4 (b) 4, 3.69
(c) 4, 3.84 (d) 3.69, 3.84

45. Consider the junction diode as ideal. The value of current flowing through AB is

(a) 10^{-1} A (b) 10^{-3} A
(c) 0 A (d) 10^{-2} A

Answer Key

EXPLANATIONS

1. **(a):** Velocity of the particle is $v = At + Bt^2$

$\frac{ds}{dt} = At + Bt^2 \cdot \int ds = \int (At + Bt^2)dt$

$\therefore s = \frac{At^2}{2} + B\frac{t^3}{3} + C$

$s(t = 1\,s) = \frac{A}{2} + \frac{B}{3} + C \cdot s(t = 2\,s) = 2A + \frac{8}{3}B + C$

Required distance $= s(t = 2\,s) - s(t = 1\,s)$

$= \left(2A + \frac{8}{3}B + C\right) - \left(\frac{A}{2} + \frac{B}{3} + C\right)$

$= \frac{3}{2}A + \frac{7}{3}B$

2. **(d):** Let the two vectors be $\vec{A}$ and $\vec{B}$.

Then, magnitude of sum of $\vec{A}$ and $\vec{B}$,

$|\vec{A} + \vec{B}| = \sqrt{A^2 + B^2 + 2AB\cos\theta}$

and magnitude of difference of $\vec{A}$ and $\vec{B}$,

$|\vec{A} - \vec{B}| = \sqrt{A^2 + B^2 - 2AB\cos\theta}$.

$|\vec{A} + \vec{B}| = |\vec{A} - \vec{B}|$ (given)

or $\sqrt{A^2 + B^2 + 2AB\cos\theta}$

$= \sqrt{A^2 + B^2 - 2AB\cos\theta}$

$\Rightarrow 4AB\cos\theta = 0$

$4AB \neq 0$, $\cos\theta = 0$ or $\theta = 90°$

3. **(a):** Given, $\vec{r} = \cos\omega t\,\hat{x} + \sin\omega t\,\hat{y}$

$\vec{v} = \frac{d\vec{r}}{dt} = -\omega\sin\omega t\,\hat{x} + \omega\cos\omega t\,\hat{y}$

$\vec{a} = \frac{d\vec{v}}{dt} = -\omega^2\cos\omega t\,\hat{x} - \omega^2\sin\omega t\,\hat{y} = -\omega^2\vec{r}$

Since position vector $(\vec{r})$ is directed away from the origin, so, acceleration $(-\omega^2\vec{r})$ is directed towards the origin.

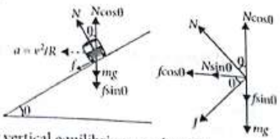
Also, $\vec{r} \cdot \vec{v}$

$= (\cos\omega t\,\hat{x} + \sin\omega t\,\hat{y}) \cdot (-\omega\sin\omega t\,\hat{x} + \omega\cos\omega t\,\hat{y})$

$= -\omega\sin\omega t\cos\omega t + \omega\sin\omega t\cos\omega t = 0$

$\Rightarrow \vec{r} \perp \vec{v}$

4. **(d):**



For vertical equilibrium on the road,

$N\cos\theta = mg + f\sin\theta$

$mg = N\cos\theta - f\sin\theta$ ...(i)

Centripetal force for safe turning,

$N\sin\theta + f\cos\theta = \frac{mv^2}{R}$ ...(ii)

From eqns. (i) and (ii), we get

$\frac{v^2}{Rg} = \frac{N\sin\theta + f\cos\theta}{N\cos\theta - f\sin\theta}$

$\Rightarrow \frac{v^2_{max}}{Rg} = \frac{N\sin\theta + \mu_s N\cos\theta}{N\cos\theta - \mu_s N\sin\theta}$

$v_{max} = \sqrt{Rg\left(\frac{\mu_s + \tan\theta}{1 - \mu_s\tan\theta}\right)}$

5. **(c):** Here, $m = 10\text{ g} = 10^{-2}$ kg,

$R = 6.4\text{ cm} = 6.4 \times 10^{-2}$ m, $K_f = 8 \times 10^{-4}$ J

$K_i = 0$, $a_t = ?$

Using work energy theorem,

Work done by all the forces = Change in KE

$W_{\text{tangential force}} + W_{\text{centripetal force}} = K_f - K_i$

$\Rightarrow F_t \times s + 0 = K_f - 0 \Rightarrow ma_t \times (2 \times 2\pi R) = K_f$

$\Rightarrow a_t = \frac{K_f}{4\pi Rm} = \frac{8\times10^{-4}}{4\times\frac{22}{7}\times6.4\times10^{-2}\times10^{-2}}$

$= 0.099 = 0.1$ m s^{-2}

6. **(b):** Here, $\vec{F} = (2t\hat{i} + 3t^2\hat{j})$ N, $m = 1$ kg

Acceleration of the body, $\vec{a} = \frac{\vec{F}}{m} = \frac{(2t\hat{i} + 3t^2\hat{j})\text{ N}}{1\text{kg}}$

Velocity of the body at time t,

$\vec{v} = \int \vec{a}dt = \int(2t\hat{i} + 3t^2\hat{j})dt = t^2\hat{i} + t^3\hat{j}$ m s^{-1}

$\therefore$ Power developed by the force at time t,

$P = \vec{F}\cdot\vec{v} = (2t\hat{i} + 3t^2\hat{j})\cdot(t^2\hat{i} + t^3\hat{j})$ W

$= (2t^3 + 3t^5)$ W

7. **(b)**

8. **(d):** Time taken by the body to reach the bottom when it rolls down on an inclined plane without slipping is given by

$t = \sqrt{\frac{2l\left(1 + \frac{k^2}{R^2}\right)}{g\sin\theta}}$

Since g is constant and l, R and $\sin\theta$ are same for both

$\therefore \frac{t_d}{t_s} = \frac{\sqrt{1 + \frac{k_d^2}{R^2}}}{\sqrt{1 + \frac{k_s^2}{R^2}}} = \sqrt{\frac{1 + \frac{R^2}{2R^2}}{1 + \frac{2R^2}{5R^2}}}$

$\left(\because k_d = \frac{R}{\sqrt{2}}, k_s = \sqrt{\frac{2}{5}}R\right)$

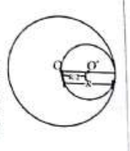
$= \sqrt{\frac{3}{2}\times\frac{5}{7}} = \sqrt{\frac{15}{14}} \Rightarrow t_d > t_s$

Hence, the sphere gets to the bottom first.

9. **(d):** Mass per unit area of disc $= \frac{M}{\pi R^2}$

Mass of removed portion of disc,

$M' = \frac{M}{\pi R^2}\times\pi\left(\frac{R}{2}\right)^2 = \frac{M}{4}$



Moment of inertia of removed portion about an axis passing through centre of disc O and perpendicular to the plane of disc,

$I'_O = I_{O'} + M'd^2$

$= \frac{1}{2}\times\frac{M}{4}\times\left(\frac{R}{2}\right)^2 + \frac{M}{4}\times\left(\frac{R}{2}\right)^2$

$= \frac{MR^2}{32} + \frac{MR^2}{16} = \frac{3MR^2}{32}$

When portion of disc would not have been removed, the moment of inertia of complete disc about centre O is

$I_O = \frac{1}{2}MR^2$

So, moment of inertia of the disc with removed portion is

$I = I_O - I'_O = \frac{1}{2}MR^2 - \frac{3MR^2}{32} = \frac{13MR^2}{32}$

10. **(c):** Given, $r = 50$ cm $= 0.5$ m, $\alpha = 2.0$ rad s^{-2}, $\omega_0 = 0$

At the end of 2 s,

Tangential acceleration, $a_t = r\alpha = 0.5 \times 2 = 1$ m s^{-2}

Radial acceleration, $a_r = \omega^2 r = (\omega_0 + \alpha t)^2 r$

$= (0 + 2\times2)^2\times0.5 = 8$ m s^{-2}

$\therefore$ Net acceleration,

$a = \sqrt{a_t^2 + a_r^2} = \sqrt{1^2 + 8^2} = \sqrt{65} \approx 8$ m s^{-2}

11. **(c):** Gravitation potential at a height h from the surface of earth, $V_h = -5.4\times10^7$ J kg^{-2}

At the same point acceleration due to gravity,

$g_h = 6$ m s^{-2}

$R = 6400$ km $= 6.4\times10^6$ m

We know, $V_h = -\frac{GM}{(R+h)}$,

$g_h = \frac{GM}{(R+h)^2} = -\frac{V_h}{R+h} \Rightarrow R + h = -\frac{V_h}{g_h}$

$\therefore h = -\frac{V_h}{g_h} - R = -\frac{(-5.4\times10^7)}{6} - 6.4\times10^6$

$= 9\times10^6 - 6.4\times10^6 = 2600$ km

12. **(d):** As escape velocity, $v = \sqrt{\frac{2GM}{R}}$

$= \sqrt{\frac{2G}{R}\cdot\frac{4\pi R^3}{3}\rho} = R\sqrt{\frac{8\pi G}{3}\rho}$

$\therefore \frac{v_e}{v_p} = \frac{R_e}{R_p}\times\sqrt{\frac{\rho_e}{\rho_p}} = \frac{1}{2}\times\sqrt{\frac{1}{2}} = \frac{1}{2\sqrt{2}}$

$(\because R_p = 2R_e$ and $\rho_p = 2\rho_e)$

13. **(b):** Linear expansion of brass $= \alpha_1$

Linear expansion of steel $= \alpha_2$

Length of brass rod $= l_1$

Length of steel rod $= l_2$

On increasing the temperature of the rods by ΔT, new lengths would be

$l'_1 = l_1(1 + \alpha_1\Delta T)$ ...(i)

$l'_2 = l_2(1 + \alpha_2\Delta T)$ ...(ii)

Subtracting eqn. (i) from eqn. (ii), we get

$$l_2' - l_1' = (l_2 - l_1) + (l_2\alpha_2 - l_1\alpha_1)\Delta T$$

According to question,

$$l_2' - l_1' = l_2 - l_1 \quad \text{(for all temperatures)}$$

$\therefore\ l_2\alpha_2 - l_1\alpha_1 = 0$ or $l_1\alpha_1 = l_2\alpha_2$

14. (a): Gravitational potential energy of a piece of ice at a height $(h) = mgh$

Heat absorbed by the ice to melt completely

$$\Delta Q = \frac{1}{4}mgh \quad \text{...(i)}$$

Also, $\Delta Q = mL$ ...(ii)

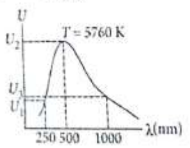
From eqns. (i) and (ii), $mL = \frac{1}{4}mgh$ or, $h = \frac{4L}{g}$

Here $L = 3.4 \times 10^5\ \mathrm{J\,kg^{-1}}$, $g = 10\ \mathrm{N\,kg^{-1}}$

$$\therefore\ h = \frac{4 \times 3.4 \times 10^5}{10} = 4 \times 34 \times 10^3 = 136\ \text{km}$$

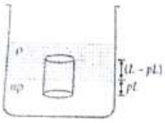
15. (b): According to Wein's displacement law

$$\lambda_m = \frac{b}{T} = \frac{2.88 \times 10^6\ \text{nm K}}{5760\ \text{K}} = 500\ \text{nm}$$



Clearly from graph, $U_1 < U_2 > U_3$

16. (b):



d = density of cylinder

A = area of cross-section of cylinder

Using law of floatation,

Weight of cylinder = Upthrust by two liquids

$L \times A \times d \times g = n\rho \times (pL \times A)g + \rho(L - pL)Ag$

$d = np\rho + \rho(1 - p) = (np + 1 - p)\rho$

$d = [1 + (n - 1)p]\rho$

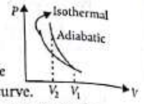
17. (d): $V_1 = V$

$V_2 = V/2$

On P-V diagram,

Area under adiabatic curve

> Area under isothermal curve.



So compressing the gas through adiabatic process will require more work to be done.

18. (d): As, $v_{rms} = \sqrt{\frac{3k_BT}{m}}$

$$\therefore\ \frac{v_{27}}{v_{127}} = \sqrt{\frac{27+273}{127+273}} = \sqrt{\frac{300}{400}} = \frac{\sqrt{3}}{2}$$

$$\text{or } v_{127} = \frac{2}{\sqrt{3}} \times v_{27} = \frac{2}{\sqrt{3}} \times 200\ \mathrm{m\,s^{-1}} = \frac{400}{\sqrt{3}}\ \mathrm{m\,s^{-1}}$$

19. (a): Given, $T_2 = 4°\text{C} = 277\ \text{K}$

$T_1 = 30°\text{C} = 303\ \text{K}$

$Q_2 = 600$ cal per second

Coefficient of performance, $\alpha = \frac{T_2}{T_1 - T_2}$

$$= \frac{277}{303 - 277} = \frac{277}{26}$$

Also, $\alpha = \frac{Q_2}{W}$

$\therefore$ Work to be done per second = power required

$$= W = \frac{Q_2}{\alpha} = \frac{26}{277} \times 600 \text{ cal per second}$$

$$= \frac{26}{277} \times 600 \times 4.2 \text{ J per second} = 236.5\ \text{W}$$

20. (a): Here, frequency of sound emitted by siren, $\upsilon_0 = 800$ Hz

Speed of source, $v_s = 15\ \mathrm{m\,s^{-1}}$

Speed of sound in air, $v = 330\ \mathrm{m\,s^{-1}}$

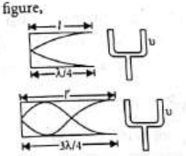
Apparent frequency of sound at the cliff = frequency heard by observer = υ

Using Doppler's effect of sound

$$\upsilon = \left(\frac{v}{v - v_s}\right)\upsilon_0 = \frac{330}{330 - 15} \times 800$$

$$= \frac{330}{315} \times 800 = 838.09\ \text{Hz} \approx 838\ \text{Hz}$$

21. (a): From figure,



First harmonic is obtained at

$$l = \frac{\lambda}{4} = 50\ \text{cm}$$

Third harmonic is obtained for resonance,

$$l' = \frac{3\lambda}{4} = 3 \times 50 = 150\ \text{cm}.$$

22. (d): Wavelength of pulse at the lower end $(\lambda_1) \propto$ velocity $(v_1) = \sqrt{\frac{T_1}{\mu}}$

Similarly, $\lambda_2 \propto v_2 = \sqrt{\frac{T_2}{\mu}}$

$$\therefore\ \frac{\lambda_2}{\lambda_1} = \sqrt{\frac{T_2}{T_1}} = \sqrt{\frac{(m_1 + m_2)g}{m_2 g}} = \sqrt{\frac{m_1 + m_2}{m_2}}$$

23. (b): Initially, the energy stored in 2 μF capacitor is

$$U_i = \frac{1}{2}CV^2 = \frac{1}{2}(2 \times 10^{-6})V^2 = V^2 \times 10^{-6}\ \text{J}$$

Initially, the charge stored in 2 μF capacitor is $Q_i = CV = (2 \times 10^{-6})V = 2V \times 10^{-6}$ coulomb. When switch S is turned to position 2, the charge flows and both the capacitors share charges till a common potential V_C is reached.

$$V_C = \frac{\text{total charge}}{\text{total capacitance}} = \frac{2V \times 10^{-6}}{(2+8) \times 10^{-6}} = \frac{V}{5}\ \text{volt}$$

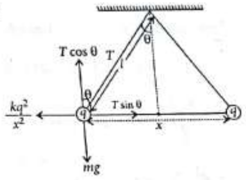
Finally, the energy stored in both the capacitors

$$U_f = \frac{1}{2}[(2 + 8) \times 10^{-6}]\left(\frac{V}{5}\right)^2 = \frac{V^2}{5} \times 10^{-6}\ \text{J}$$

$$\%\text{ loss of energy, } \Delta U = \frac{U_i - U_f}{U_i} \times 100\ \%$$

$$= \frac{(V^2 - V^2/5) \times 10^{-6}}{V^2 \times 10^{-6}} \times 100\ \% = 80\%$$

24. (a):



From figure, $T\cos\theta = mg$ ...(i)

$$T\sin\theta = \frac{kq^2}{x^2} \quad \text{...(ii)}$$

From eqns. (i) and (ii), $\tan\theta = \frac{kq^2}{x^2 mg}$

Since θ is small, $\therefore\ \tan\theta \approx \sin\theta = \frac{x}{2l}$

$$\therefore\ \frac{x}{2l} = \frac{kq^2}{x^2 mg} \Rightarrow q^2 = x^3\frac{mg}{2lk} \text{ or } q \propto x^{3/2}$$

$$\Rightarrow \frac{dq}{dt} \propto \frac{3}{2}\sqrt{x}\frac{dx}{dt} = \frac{3}{2}\sqrt{x}v.$$

Since, $\frac{dq}{dt}$ = constant

$$\therefore\ v \propto \frac{1}{\sqrt{x}}$$

25. (b): Suppose two cells have emfs ε_1 and ε_2 (also $\varepsilon_1 > \varepsilon_2$).

Potential difference per unit length of the potentiometer wire = k (say)

When ε_1 and ε_2 are in series and support each other then

$$\varepsilon_1 + \varepsilon_2 = 50 \times k \quad \text{...(i)}$$

When ε_1 and ε_2 are in opposite direction

$$\varepsilon_1 - \varepsilon_2 = 10 \times k \quad \text{...(ii)}$$

On adding eqn. (i) and eqn. (ii)

$2\varepsilon_1 = 60k \Rightarrow \varepsilon_1 = 30k$ and

$\varepsilon_2 = 50k - 30k = 20k$

$$\therefore\ \frac{\varepsilon_1}{\varepsilon_2} = \frac{30k}{20k} = \frac{3}{2}$$

26. (c): Given, $Q = at - bt^2$

$$\therefore\ I = \frac{dQ}{dt} = a - 2bt$$

At $t = 0, Q = 0 \Rightarrow I = 0$

Also, $I = 0$ at $t = a/2b$

$\therefore$ Total heat produced in resistance R,

$$H = \int_0^{a/2b} I^2 R\,dt = R\int_0^{a/2b} (a-2bt)^2\,dt$$

$$= R\int_0^{a/2b} (a^2+4b^2t^2-4abt)\,dt$$

$$= R\left[a^2t+4b^2\frac{t^3}{3}-4ab\frac{t^2}{2}\right]_0^{a/2b}$$

$$= R\left[a^2\times\frac{a}{2b}+\frac{4b^2}{3}\times\frac{a^3}{8b^3}-\frac{4ab}{2}\times\frac{a^2}{4b^2}\right]$$

$$= \frac{a^3R}{b}\left[\frac{1}{2}+\frac{1}{6}-\frac{1}{2}\right]=\frac{a^3R}{6b}$$

27. **(a)**: Magnetic field at a point inside the wire at distance $r\left(=\frac{a}{2}\right)$ from the axis of wire is

$$B = \frac{\mu_0 I}{2\pi a^2}r = \frac{\mu_0 I}{2\pi a^2}\times\frac{a}{2}=\frac{\mu_0 I}{4\pi a}$$

Magnetic field at a point outside the wire at distance $r(=2a)$ from the axis of wire is

$$B' = \frac{\mu_0 I}{2\pi r}=\frac{\mu_0 I}{2\pi}\times\frac{1}{2a}=\frac{\mu_0 I}{4\pi a} \quad \therefore \quad \frac{B}{B'}=1$$

28. **(c)**: Force on arm AB due to current in conductor XY is

$$F_1 = \frac{\mu_0}{4\pi}\frac{2IiL}{(L/2)}=\frac{\mu_0 Ii}{\pi}$$

acting towards XY in the plane of loop.
Force on arm CD due to current in conductor XY is

$$F_2 = \frac{\mu_0}{4\pi}\frac{2IiL}{3(L/2)}=\frac{\mu_0 Ii}{3\pi}$$

acting away from XY in the plane of loop.
$\therefore$ Net force on the loop $= F_1 - F_2$

$$= \frac{\mu_0 Ii}{\pi}\left[1-\frac{1}{3}\right]=\frac{2}{3}\frac{\mu_0 Ii}{\pi}$$

29. **(c)**: Magnetic susceptibility is negative for diamagnetic material only.

30. **(c)**: Here, $L = 20\text{ mH} = 20\times10^{-3}$ H,
$C = 50\ \mu\text{F} = 50\times10^{-6}$ F
$R = 40\ \Omega$, $V = 10\sin 340t = V_0\sin\omega t$
$\omega = 340$ rad s^{-1}, $V_0 = 10$ V

$$X_L = \omega L = 340\times20\times10^{-3} = 6.8\ \Omega$$

$$X_C = \frac{1}{\omega C}=\frac{1}{340\times50\times10^{-6}}=\frac{10^4}{34\times5}=58.82\ \Omega$$

$$Z=\sqrt{R^2+(X_C-X_L)^2}$$

$$=\sqrt{(40)^2+(58.82-6.8)^2}$$

$$=\sqrt{(40)^2+(52.02)^2}=65.62\ \Omega$$

The peak current in the circuit is

$$I_0=\frac{V_0}{Z}=\frac{10}{65.62}\text{ A},\ \cos\phi=\frac{R}{Z}=\left(\frac{40}{65.62}\right)$$

Power loss in A.C. circuit,

$$=V_{rms}I_{rms}\cos\phi=\frac{1}{2}V_0I_0\cos\phi$$

$$=\frac{1}{2}\times10\times\frac{10}{65.62}\times\frac{40}{65.62}=0.46\text{ W}$$

31. **(d)**: When an ideal capacitor is connected with an ac voltage source, current leads voltage by 90°. Since, energy stored in capacitor during charging is spent in maintaining charge on the capacitor during discharging. Hence over a full cycle the capacitor does not consume any energy from the voltage source.

32. **(b)**: Here, $N = 1000$, $I = 4$ A, $\phi_0 = 4\times10^{-3}$ Wb
Total flux linked with the solenoid, $\phi = N\phi_0$
$= 1000\times4\times10^{-3}$ Wb $= 4$ Wb
Since, $\phi = LI$
$\therefore$ Self-inductance of solenoid,

$$L=\frac{\phi}{I}=\frac{4\text{ Wb}}{4\text{ A}}=1\text{ H}$$

33. **(b)**: An accelerating charge is used to produce oscillating electric and magnetic fields, hence the electromagnetic wave.

34. **(c)**: Magnification in the mirror, $m=-\frac{v}{u}$
$m = -2 \Rightarrow v = 2u$
As v and u have same signs so the mirror is concave and image formed is real.
$m=-\frac{1}{2}\Rightarrow v=\frac{u}{2}\Rightarrow$ Concave mirror and real image.
$m = +2 \Rightarrow v = -2u$

As v and u have different signs but magnification is 2 so the mirror is concave and image formed is virtual.
$m=+\frac{1}{2}\Rightarrow v=-\frac{u}{2}$
As v and u have different signs with magnification $\left(\frac{1}{2}\right)$ so the mirror is convex and image formed is virtual.

35. **(b)**: For first minimum,
the path difference between extreme waves,
$a\sin\theta=\lambda$
Here $\theta = 30° \Rightarrow \sin\theta=\frac{1}{2}$
$\therefore\ a = 2\lambda$ ...(i)
For first secondary maximum, the path difference between extreme waves

$$a\sin\theta'=\frac{3}{2}\lambda \text{ or } (2\lambda)\sin\theta'=\frac{3}{2}\lambda$$

[Using eqn (i)]

$$\text{or } \sin\theta'=\frac{3}{4} \quad \therefore \quad \theta'=\sin^{-1}\left(\frac{3}{4}\right)$$

36. **(b)**: Here, $d = 5\lambda$, $D = 10d$, $y=\frac{d}{2}$.
Resultant Intensity at $y=\frac{d}{2}, I_y=?$
The path difference between two waves at $y=\frac{d}{2}$

$$\Delta x=d\tan\theta=d\times\frac{y}{D}=\frac{d\times\frac{d}{2}}{10d}=\frac{d}{20}=\frac{5\lambda}{20}=\frac{\lambda}{4}$$

Corresponding phase difference, $\phi=\frac{2\pi}{\lambda}\Delta x=\frac{\pi}{2}$.
Now, maximum intensity in Young's double slit experiment,
$I_{max}=I_1+I_2+2I_1I_2$
$I_0=4I$ $\quad(\because\ I_1=I_1=I)$
$\therefore\ I=\frac{I_0}{4}$.
Required inte nsity $I_y=I_1+I_2+2I_1I_2\cos\frac{\pi}{2}=2I$
$=\frac{I_0}{2}$

37. **(b)**: Here $f_o = 40$ cm, $f_e = 4$ cm
Tube length(l) = Distance between lenses = $v_o + f_e$
For objective lens,
$u_o = -200$ cm, $v_o = ?$

$$\frac{1}{v_o}-\frac{1}{u_o}=\frac{1}{f_o} \text{ or } \frac{1}{v_o}-\frac{1}{-200}=\frac{1}{40}$$

$$\text{or } \frac{1}{v_o}=\frac{1}{40}-\frac{1}{200}=\frac{4}{200} \quad \therefore\ v_o=50\text{ cm}$$

$\therefore\ l = 50 + 4 = 54$ cm

38. **(d)**: Given, $i = 45°$, $A = 60°$
Since the ray undergoes minimum deviation, therefore, angle of emergence from second face,
$e = i = 45°$
$\therefore\ \delta_m = i + e - A = 45° + 45° - 60° = 30°$

$$\mu=\frac{\sin\left(\frac{A+\delta_m}{2}\right)}{\sin\left(\frac{A}{2}\right)}=\frac{\sin\left(\frac{60°+30°}{2}\right)}{\sin\left(\frac{60°}{2}\right)}$$

$$=\frac{\sin45°}{\sin30°}=\frac{1}{\sqrt{2}}\times\frac{2}{1}=\sqrt{2}$$

39. **(c)**: For electron of energy E,
de-Broglie wavelength, $\lambda_e=\frac{h}{p}=\frac{h}{\sqrt{2mE}}$
For photon of energy, $E=h\upsilon=\frac{hc}{\lambda_p}$
$\Rightarrow\ \lambda_p=\frac{hc}{E}$ ...(ii)

$$\therefore\ \frac{\lambda_e}{\lambda_p}=\frac{h}{\sqrt{2mE}}\times\frac{E}{hc}=\frac{1}{c}\left(\frac{E}{2m}\right)^{1/2}$$

40. **(b)**: According to Einstein's photoelectric equation,

$$eV_s=\frac{hc}{\lambda}-\frac{hc}{\lambda_0}$$

$\therefore$ As per question, $eV=\frac{hc}{\lambda}-\frac{hc}{\lambda_0}$ ...(i)

$\frac{eV}{4}=\frac{hc}{2\lambda}-\frac{hc}{\lambda_0}$ ...(ii)

From equations (i) and (ii), we get

$$\frac{hc}{2\lambda}-\frac{hc}{4\lambda}=\frac{hc}{\lambda_0}-\frac{hc}{4\lambda_0}$$

$$\Rightarrow \frac{hc}{4\lambda}=\frac{3hc}{4\lambda_0} \quad\text{or}\quad \lambda_0=3\lambda$$

41. (a) : Here, $R = 10^7\ m^{-1}$
The wave number of the last line of the Balmer series in hydrogen spectrum is given by

$$\frac{1}{\lambda} = R\left(\frac{1}{2^2} - \frac{1}{\infty^2}\right) = \frac{R}{4} = \frac{10^7}{4} = 0.25 \times 10^7\ m^{-1}$$

42. (c) : Distance of closest approach when an α-particle of mass m moving with velocity v is bombarded on a heavy nucleus of charge Ze, is given by

$$r_0 = \frac{Ze^2}{\pi\varepsilon_0 mv^2} \quad \therefore \quad r_0 \propto \frac{1}{m}$$

43. (b) :

Output of the circuit, $Y = (A + B)\cdot C$

$Y = 1$ if $C = 1$ and $A = 0, B = 1$ or $A = 1, B = 0$ or $A = B = 1$

44. (c) : Here, $R_0 = 800\ \Omega$, $R_i = 192\ \Omega$,
current gain, $\beta = 0.96$
Voltage gain = Current gain × Resistance gain

$$= 0.96 \times \frac{800}{192} = 4$$

Power gain = [Current gain] × [Voltage gain]
$= 0.96 \times 4 = 3.84$

45. (d) : Here, the p-n junction diode is forward biased, hence it offers zero resistance.

$$\therefore\ I_{AB} = \frac{V_A - V_B}{R_{AB}} = \frac{4V - (-6V)}{1k\Omega}$$

$$= \frac{10}{1000} A = 10^{-2} A$$

CHAPTER 1

Units and Measurements

1. If dimensions of critical velocity v_c of a liquid flowing through a tube are expressed as $[\eta^x \rho^y r^z]$ where η, ρ and r are the coefficient of viscosity of liquid, density of liquid and radius of the tube respectively, then the values of x, y and z are given by
(a) $-1, -1, -1$
(b) $1, 1, 1$
(c) $1, -1, -1$
(d) $-1, -1, 1$
(AIPMT 2015)

2. If energy (E), velocity (V) and time (T) are chosen as the fundamental quantities, the dimensional formula of surface tension will be
(a) $[EV^{-2}T^{-2}]$
(b) $[E^{-2}V^{-1}T^{-3}]$
(c) $[EV^{-2}T^{-1}]$
(d) $[EV^{-1}T^{-2}]$
(AIPMT 2015, Cancelled)

3. If force (F), velocity (V) and time (T) are taken as fundamental units, then the dimensions of mass are
(a) $[FVT^{-1}]$
(b) $[FVT^{-2}]$
(c) $[FV^{-1}T^{-1}]$
(d) $[FV^{-1}T]$
(AIPMT 2014)

4. In an experiment four quantities a, b, c and d are measured with percentage error 1%, 2%, 3% and 4% respectively. Quantity P is calculated as follows

$$P = \frac{a^3b^2}{cd}$$

% error in P is
(a) 7%
(b) 4%
(c) 14%
(d) 10%
(NEET 2013)

5. The pair of quantities having same dimensions is
(a) Impulse and Surface Tension
(b) Angular momentum and Work
(c) Work and Torque
(d) Young's modulus and Energy
(Karnataka NEET 2013)

6. The damping force on an oscillator is directly proportional to the velocity. The units of the constant of proportionality are
(a) $kg\ m\ s^{-1}$
(b) $kg\ m\ s^{-2}$
(c) $kg\ s^{-1}$
(d) $kg\ s$
(Prelims 2012)

7. The dimensions of $(\mu_0\varepsilon_0)^{-1/2}$ are
(a) $[L^{1/2}T^{-1/2}]$
(b) $[L^{-1}T]$
(c) $[LT^{-1}]$
(d) $[L^{1/2}T^{1/2}]$
(Mains 2012, Prelims 2011)

8. The density of a material in CGS system of units is $4\ g\ cm^{-3}$. In a system of units in which unit of length is 10 cm and unit of mass is 100 g, the value of density of material will be
(a) 0.04
(b) 0.4
(c) 40
(d) 400
(Mains 2011)

9. The dimension of $\frac{1}{2}\varepsilon_0 E^2$, where ε_0 is permittivity of free space and E is electric field, is
(a) ML^2T^{-2}
(b) $ML^{-1}T^{-2}$
(c) ML^2T^{-1}
(d) MLT^{-1}
(Prelims 2010)

10. A student measures the distance traversed in free fall of a body, initially at rest, in a given time. He uses this data to estimate g, the acceleration due to gravity. If the maximum percentage errors in measurement of the distance and the time are e_1 and e_2 respectively, the percentage error in the estimation of g is
(a) $e_2 - e_1$
(b) $e_1 + 2e_2$
(c) $e_1 + e_2$
(d) $e_1 - 2e_2$
(Mains 2010)

11. If the dimensions of a physical quantity are given by $M^aL^bT^c$, then the physical quantity will be

(a) velocity if $a = 1, b = 0, c = -1$
(b) acceleration if $a = 1, b = 1, c = -2$
(c) force if $a = 0, b = -1, c = -2$
(d) pressure if $a = 1, b = -1, c = -2$ *(Prelims 2009)*

12. If the error in the measurement of radius of a sphere is 2%, then the error in the determination of volume of the sphere will be
(a) 8% (b) 2%
(c) 4% (d) 6% *(Prelims 2008)*

13. Which two of the following five physical parameters have the same dimensions ?
1. energy density 2. refractive index
3. dielectric constant 4. Young's modulus
5. magnetic field
(a) 1 and 4 (b) 1 and 5
(c) 2 and 4 (d) 3 and 5 *(Prelims 2008)*

14. Dimensions of resistance in an electrical circuit, in terms of dimension of mass M, of length L, of time T and of current I, would be
(a) $[ML^2T^{-2}]$ (b) $[ML^2T^{-1}I^{-1}]$
(c) $[ML^2T^{-3}I^{-2}]$ (d) $[ML^2T^{-3}I^{-1}]$. *(2007)*

15. The velocity v of a particle at time t is given by $v = at + \frac{b}{t+c}$, where a, b and c are constants. The dimensions of a, b and c are
(a) [L], [LT] and $[LT^{-2}]$
(b) $[LT^{-2}]$, [L] and [T]
(c) $[L^2]$, [T] and $[LT^2]$
(d) $[LT^{-2}]$, [LT] and [L]. *(2006)*

16. The ratio of the dimensions of Planck constant and that of moment of inertia is the dimensions of
(a) time (b) frequency
(c) angular momentum (d) velocity. *(2005)*

17. The dimensions of universal gravitational constant are
(a) $[M^{-1}L^3T^{-2}]$ (b) $[ML^2T^{-1}]$
(c) $[M^{-2}L^3T^{-2}]$ (d) $[M^{-2}L^2T^{-1}]$ *(2004, 1992)*

18. The unit of permittivity of free space, ε_0, is
(a) coulomb/newton-metre
(b) newton-metre²/coulomb²
(c) coulomb²/newton-metre²
(d) coulomb²/(newton-metre)² *(2004)*

19. The dimensions of Planck constant equals to that of
(a) energy (b) momentum
(c) angular momentum (d) power. *(2001)*

20. Which pair do not have equal dimensions ?
(a) Energy and torque
(b) Force and impulse
(c) Angular momentum and Planck constant
(d) Elastic modulus and pressure. *(2000)*

21. The dimensional formula of magnetic flux is
(a) $[M^0L^{-2}T^{-2}A^{-2}]$ (b) $ML^0T^{-2}A^{-2}]$
(c) $[ML^2T^{-2}A^{-1}]$ (d) $[ML^2T^{-1}A^3]$ *(1999)*

22. An equation is given here $\left(P + \frac{a}{V^2}\right) = b\frac{\theta}{V}$ where P = Pressure, V = Volume and θ = Absolute temperature. If a and b are constants, the dimensions of a will be
(a) $[ML^{-5}T^{-1}]$ (b) $[ML^5T^1]$
(c) $[ML^5T^{-2}]$ (d) $[M^{-1}L^5T^2]$. *(1996)*

23. The density of a cube is measured by measuring its mass and length of its sides. If the maximum error in the measurement of mass and lengths are 3% and 2% respectively, the maximum error in the measurement of density would be
(a) 12% (b) 14%
(c) 7% (d) 9%. *(1996)*

24. The dimensions of impulse are equal to that of
(a) pressure (b) linear momentum
(c) force (d) angular momentum. *(1996)*

25. Which of the following dimensions will be the same as that of time?
(a) $\frac{L}{R}$ (b) $\frac{C}{L}$
(c) LC (d) $\frac{R}{L}$. *(1996)*

26. Which of the following is a dimensional constant?
(a) Relative density
(b) Gravitational constant
(c) Refractive index
(d) Poisson ratio. *(1995)*

27. The dimensions of RC is
(a) square of time (b) square of inverse time
(c) time (d) inverse time. *(1995)*

28. Percentage errors in the measurement of mass and speed are 2% and 3% respectively. The error in the estimate of kinetic energy obtained by measuring mass and speed will be
(a) 8% (b) 2%
(c) 12% (d) 10%. *(1995)*

29. Which of the following has the dimensions of pressure?
(a) $[MLT^{-2}]$ (b) $[ML^{-1}T^{-2}]$
(c) $[ML^{-2}T^{-2}]$ (d) $[M^{-1}L^{-1}]$. *(1994, 90)*

30. Turpentine oil is flowing through a tube of length l and radius r. The pressure difference between the two ends of the tube is P. The viscosity of oil is given by $\eta = \frac{P(r^2 - x^2)}{4vl}$ where v is the velocity of oil at a distance x from the axis of the tube. The dimensions of η are
(a) $[M^0L^0T^0]$ (b) $[MLT^{-1}]$
(c) $[ML^2T^{-2}]$ (d) $[ML^{-1}T^{-1}]$ *(1993)*

31. The time dependence of a physical quantity p is given by $p = p_0 \exp(-\alpha t^2)$, where α is a constant and t is the time. The constant α
(a) is dimensionless
(b) has dimensions $[T^{-2}]$
(c) has dimensions $[T^2]$
(d) has dimensions of p *(1993)*

32. P represents radiation pressure, c represents speed of light and S represents radiation energy striking per unit area per sec. The non zero integers x, y, z such that $P^xS^yc^z$ is dimensionless are
(a) $x = 1, y = 1, z = 1$ (b) $x = -1, y = 1, z = 1$
(c) $x = 1, y = -1, z = 1$ (d) $x = 1, y = 1, z = -1$ *(1992)*

33. A certain body weighs 22.42 g and has a measured volume of 4.7cc. The possible error in the measurement of mass and volume are 0.01 g and 0.1 cc. Then maximum error in the densiy will be
(a) 22% (b) 2%
(c) 0.2% (d) 0.02%. *(1991)*

34. The dimensional formula of permeability of free space μ_0 is
(a) $[MLT^{-2}A^{-2}]$ (b) $[M^0L^1T]$
(c) $[M^0L^2T^{-1}A^2]$ (d) none of these. *(1991)*

35. The frequency of vibration f of a mass m suspended from a spring of spring constant k is given by a relation $f = am^xk^y$, where a is a dimensionless constant. The values of x and y are
(a) $x = \frac{1}{2}, y = \frac{1}{2}$ (b) $x = -\frac{1}{2}, y = -\frac{1}{2}$
(c) $x = \frac{1}{2}, y = -\frac{1}{2}$ (d) $x = -\frac{1}{2}, y = \frac{1}{2}$. *(1990)*

36. According to Newton, the viscous force acting between liquid layers of area A and velocity gradient $\Delta v/\Delta Z$ is given by $F = -\eta A\frac{\Delta v}{\Delta Z}$, where η is constant called coefficient of viscosity. The dimensional formula of η is
(a) $[ML^{-2}T^{-2}]$ (b) $[M^0L^0T^0]$
(c) $[ML^2T^{-2}]$ (d) $[ML^{-1}T^{-1}]$. *(1990)*

37. If $x = at + bt^2$, where x is the distance travelled by the body in kilometers while t is the time in seconds, then the units of b is
(a) km/s (b) kms
(c) km/s² (d) kms². *(1989)*

38. Of the following quantities, which one has dimensions different from the remaining three ?
(a) Energy per unit volume
(b) Force per unit area
(c) Product of voltage and charge per unit volume
(d) Angular momentum. *(1989)*

39. Dimensional formula of self inductance is
(a) $[MLT^{-2}A^{-2}]$ (b) $[ML^2T^{-1}A^{-2}]$
(c) $[ML^2T^{-2}A^{-2}]$
(d) $[ML^2T^{-2}A^{-1}]$. *(1989)*

40. The dimensional formula of torque is
(a) $[ML^2T^{-2}]$ (b) $[MLT^{-2}]$
(c) $[ML^{-1}T^{-2}]$ (d) $[ML^{-2}T^{-2}]$. *(1989)*

41. If C and R denote capacitance and resistance, the dimensional formula of CR is
(a) $[M^0L^0T^1]$ (b) $[M^0L^0T^0]$
(c) $[M^0L^0T^{-1}]$
(d) not expressible in terms of MLT. *(1988)*

42. The dimensional formula of angular momentum is
(a) $[ML^2T^{-2}]$ (b) $[ML^{-2}T^{-1}]$
(c) $[MLT^{-1}]$ (d) $[ML^2T^{-1}]$. *(1988)*

EXPLANATIONS

1. **(c)** : $[v_c] = [\eta^x \rho^y r^z]$ (given) ...(i)
Writing the dimensions of various quantities in eqn. (i), we get
$[M^0LT^{-1}] = [ML^{-1}T^{-1}]^x[ML^{-3}T^0]^y[M^0LT^0]^z$
$= [M^{x+y}L^{-x-3y+z}T^{-x}]$
Applying the principle of homogeneity of dimensions, we get
$x + y = 0;\ -x - 3y + z = 1;\ -x = -1$
On solving, we get
$x = 1, y = -1, z = -1$

2. **(a)** : Let $S = kE^aV^bT^c$
where k is a dimensionless constant.
Writing the dimensions on both sides, we get
$[M^1L^0T^{-2}] = [ML^2T^{-2}]^a[LT^{-1}]^b[T]^c$
$= [M^aL^{2a+b}T^{-2a-b+c}]$
Applying principle of homogeneity of dimensions, we get, $a = 1$ ...(i)
$2a + b = 0$ ...(ii)
$-2a - b + c = -2$ ...(iii)
Adding (ii) and (iii), we get
$c = -2$
From (ii), $b = -2a = -2$
$\therefore\ S = kEV^{-2}T^{-2}$ or $[S] = [EV^{-2}T^{-2}]$

3. **(d)** : Let mass $m \propto F^aV^bT^c$
or $m = kF^aV^bT^c$ ...(i)
where k is a dimensionless constant and a, b and c are the exponents.
Writing dimensions on both sides, we get
$[ML^0T^0] = [MLT^{-2}]^a[LT^{-1}]^b[T]^c$
$[ML^0T^0] = [M^aL^{a+b}T^{-2a-b+c}]$
Applying the principle of homogeneity of dimensions, we get
$a = 1$ ...(ii)
$a + b = 0$ ...(iii)
$-2a - b + c = 0$ ...(iv)
Solving eqns. (ii), (iii) and (iv), we get
$a = 1, b = -1, c = 1$
From eqn. (i), $[m] = [FV^{-1}T]$

4. **(c)** : As $P = \dfrac{a^3b^2}{cd}$
% error in P is
$$\frac{\Delta P}{P} \times 100 = \left[3\left(\frac{\Delta a}{a}\right) + 2\left(\frac{\Delta b}{b}\right) + \frac{\Delta c}{c} + \frac{\Delta d}{d}\right] \times 100$$
$= [3 \times 1\% + 2 \times 2\% + 3\% + 4\%]$
$= 14\%$

5. **(c)** : Impulse = Force × time
$= [MLT^{-2}][T] = [MLT^{-1}]$
Surface tension $= \dfrac{\text{Force}}{\text{length}} = \dfrac{[MLT^{-2}]}{[L]} = [ML^0T^{-2}]$
Angular momentum
= Moment of inertia × angular velocity
$= [ML^2][T^{-1}] = [ML^2T^{-1}]$
Work = Force × distance
$= [MLT^{-2}][L] = [ML^2T^{-2}]$
Energy $= [ML^2T^{-2}]$
Torque = Force × distance
$= [MLT^{-2}][L] = [ML^2T^{-2}]$
Young's modulus
$$= \frac{\text{Force / Area}}{\text{Change in length / original length}}$$
$$= \frac{[MLT^{-2}]/[L^2]}{[L]/[L]} = [ML^{-1}T^{-2}]$$
Hence, among the given pair of physical quantities work and torque have the same dimensions $[ML^2T^{-2}]$.

6. **(c)** : Damping force, $F \propto v$ or $F = kv$
where k is the constant of proportionality
$$\therefore\ k = \frac{F}{v} = \frac{N}{m\,s^{-1}} = \frac{kg\,m\,s^{-2}}{m\,s^{-1}} = kg\,s^{-1}$$

7. **(c)** : The speed of the light in vacuum is
$$c = \frac{1}{\sqrt{\mu_0\varepsilon_0}} = (\mu_0\varepsilon_0)^{-1/2}$$
$\therefore\ [(\mu_0\varepsilon_0)^{-1/2}] = [c] = [LT^{-1}]$

8. **(c)** : As $n_1u_1 = n_2u_2$
$$4\frac{g}{cm^3} = n_2\frac{100g}{(10\ cm)^3} \Rightarrow n_2 = 40$$

9. **(b)** : Energy density of an electric field E is
$$u_E = \frac{1}{2}\varepsilon_0E^2$$
where ε_0 is permittivity of free space
$$u_E = \frac{\text{Energy}}{\text{Volume}} = \frac{ML^2T^{-2}}{L^3}$$
$= ML^{-1}T^{-2}$
Hence, the dimension of $\frac{1}{2}\varepsilon_0E^2$ is $ML^{-1}T^{-2}$

10. (b) : From the relation

$$h = ut + \frac{1}{2}gt^2$$

$$h = \frac{1}{2}gt^2 \Rightarrow g = \frac{2h}{t^2} \quad (\because \text{ body initially at rest})$$

Taking natural logarithm on both sides, we get

$\ln g = \ln h - 2\ln t$

Differentiating, $\frac{\Delta g}{g} = \frac{\Delta h}{h} - 2\frac{\Delta t}{t}$

For maximum permissible error,

or $\left(\frac{\Delta g}{g}\times 100\right)_{max} = \left(\frac{\Delta h}{h}\times 100\right) + 2\times\left(\frac{\Delta t}{t}\times 100\right)$

According to problem

$\frac{\Delta h}{h}\times 100 = e_1$ and $\frac{\Delta t}{t}\times 100 = e_2$

Therefore, $\left(\frac{\Delta g}{g}\times 100\right)_{max} = e_1 + 2e_2$

11. (d) : Pressure, $P = \frac{\text{force}}{\text{area}} = \frac{\text{mass} \times \text{acceleration}}{\text{area}}$

$\therefore [P] = \frac{M^1LT^{-2}}{L^2} = [M^1L^{-1}T^{-2}] = M^aL^bT^c.$

$\therefore a = 1, b = -1, c = -2.$

12. (d) : $V = \frac{4}{3}\pi R^3$; $\ln V = \ln\left(\frac{4}{3}\pi\right) + \ln R^3$

Differentiating, $\frac{dV}{V} = 3\frac{dR}{R}$

Error in the determination of the volume

$= 3 \times 2\% = 6\%$

13. (a) : $[\text{Energy density}] = \left[\frac{\text{Work done}}{\text{Volume}}\right] = \frac{MLT^{-2}\cdot L}{L^3}$
$= [ML^{-1}T^{-2}]$

$[\text{Young's modulus}] = [Y] = \left[\frac{\text{Force}}{\text{Area}}\right]\times\frac{[l]}{[\Delta l]}$

$= \frac{MLT^{-2}}{L^2}\cdot\frac{L}{L} = [ML^{-1}T^{-2}]$

The dimensions of 1 and 4 are the same.

14. (c) : According to Ohm's law,

$V = RI$ or $R = \frac{V}{I}$

Dimensions of $V = \frac{W}{q} = \frac{[ML^2T^{-2}]}{[IT]}$

$\therefore R = \frac{[ML^2T^{-2}/IT]}{[I]} = [ML^2T^{-3}I^{-2}].$

15. (b) : $v = at + \frac{b}{t+c}$

As c is added to t, $\therefore [c] = [T]$

$[at] = [LT^{-1}]$ or, $[a] = \frac{[LT^{-1}]}{[T]} = [LT^{-2}]$

$\frac{[b]}{[T]} = [LT^{-1}]$ $\therefore [b] = [L].$

16. (b) : $\frac{h}{I} = \frac{E\lambda}{c\times I} = \frac{[ML^2T^{-2}][L]}{[LT^{-1}]\times[ML^2]}$

$\frac{h}{I} = [T^{-1}] = \text{frequency}.$

17. (a) : Gravitational constant G

$= \frac{\text{force} \times (\text{distance})^2}{\text{mass} \times \text{mass}}$

$\therefore$ Dimensions of $G = \frac{[MLT^{-2}][L^2]}{[M][M]}$
$= [M^{-1}L^3T^{-2}]$

18. (c) : Force between two charges

$F = \frac{1}{4\pi\varepsilon_0}\frac{q^2}{r^2} \Rightarrow \varepsilon_0 = \frac{1}{4\pi}\frac{q^2}{Fr^2} = C^2/N\text{-}m^2$

19. (c) : Dimensions of Planck constant $h = \frac{\text{Energy}}{\text{Frequency}}$

$= \frac{[ML^2T^{-2}]}{[T^{-1}]} = [ML^2T^{-1}]$

Dimensions of angular momentum L
$=$ Moment of inertia I × Angular velocity ω
$= [ML^2][T^{-1}] = [ML^2T^{-1}]$

20. (b) : Dimensions of force $= [MLT^{-2}]$
Dimensions of impulse $= [MLT^{-1}]$.

21. (c) : Magnetic flux, $\phi = BA = \left(\frac{F}{Il}\right)A$

$= \frac{[MLT^{-2}][L^2]}{[A][L]} = [ML^2T^{-2}A^{-1}].$

22. (c) : Equation $\left(P + \frac{a}{V^2}\right) = b\,\frac{\theta}{V}$. Since $\frac{a}{V^2}$ is added to the pressure, therefore dimensions of

$\frac{a}{V^2}$ and pressure (P) will be the same. And dimensions of $\frac{a}{V^2} = \frac{a}{[L^3]^2} = [ML^{-1}T^{-2}]$

or $a = [ML^5T^{-2}]$.

23. (d) : Maximum error in mass $\left(\frac{\Delta m}{m}\right) = 3\% = \frac{3}{100}$

and maximum error in length $\left(\frac{\Delta l}{l}\right) = 2\% = \frac{2}{100}$.

Maximum error in the measurement of density,

$\frac{\Delta\rho}{\rho} = \frac{\Delta m}{m} + \left(3\times\frac{\Delta l}{l}\right) = \frac{3}{100} + \left(3\times\frac{2}{100}\right) = \frac{3}{100} + \frac{6}{100}$

$= \frac{9}{100} = 9\%.$

24. (b) : Impulse = Force × Time.
Therefore dimensional formula of impulse = Dimensional formula of force × Dimensional formula of time $= [MLT^{-2}]\,[T] = [MLT^{-1}]$ and dimensional formula of linear momentum $[p] = MLT^{-1}$.

25. (a)

26. (b) : Relative density, refractive index and Poisson ratio all the three are ratios, therefore they are dimensionless constants.

27. (c) : Units of RC = ohm × ohm^{-1} × second = second. Therefore dimensions of RC = time.

28. (a) : Percentage error in mass $= 2\% = \frac{2}{100}$ and percentage error in speed $= 3\% = \frac{3}{100}$.

$$K.E. = \frac{1}{2}mv^2$$

Therefore the error in measurement of kinetic energy

$\frac{\Delta K.E.}{K.E.} = \frac{\Delta m}{m} + 2\times\frac{\Delta v}{v} = \frac{2}{100} + 2\times\frac{3}{100} = \frac{8}{100} = 8\%$

29. (b) : Pressure $= \frac{\text{Force}}{\text{Area}}$. Therefore dimensions of pressure $= \frac{[MLT^{-2}]}{[L^2]} = ML^{-1}T^{-2}$.

30. (d) : Dimensions of $P = [ML^{-1}T^{-2}]$
Dimensions of $r = [L]$
Dimensions of $v = [LT^{-1}]$
Dimensions of $l = [L]$
$\therefore$ Dimensions of

$\eta = \frac{[P][r^2 - x^2]}{[4vl]} = \frac{[ML^{-1}T^{-2}][L^2]}{[LT^{-1}][L]}$
$= [ML^{-1}T^{-1}]$

31. (b) : Given : $p = p_0e^{-\alpha t^2}$
αt^2 is a dimensionless

$\therefore \alpha = \frac{1}{t^2} = \frac{1}{[T^2]} = [T^{-2}]$

32. (c) : Let $k = P^xS^yc^z$ .....(i)
k is a dimensionless
Dimensions of $k = [M^0L^0T^0]$
$\therefore$ Dimensions of P

$= \frac{\text{Force}}{\text{Area}} = \frac{[MLT^{-2}]}{[L^2]} = [ML^{-1}T^{-2}]$

Dimensions of S =

$$\frac{\text{Energy}}{\text{Area} \times \text{time}} = \frac{[ML^2T^{-2}]}{[L^2][T]} = [MT^{-3}]$$

Dimensions of $c = [LT^{-1}]$
Substituting these dimensions in eqn (i), we get
$[M^0L^0T^0] = [ML^{-1}T^{-2}]^x\,[MT^{-3}]^y\,[LT^{-1}]^z$.
Applying the principle of homogeneity of dimensions, we get

$x + y = 0$ .....(ii)
$-x + z = 0$ .....(iii)
$-2x - 3y - z = 0$ .....(iv)

Solving (ii), (iii) and (iv), we get
$x = 1, y = -1, z = 1$

33. (b) : Density $\rho = \frac{\text{mass } m}{\text{volume } V}$ .....(i)

Take logarithm to take base e on the both sides of eqn (i), we get

$\ln\rho = \ln m - \ln V$ .....(ii)

Differentiate eqn (ii), on both sides, we get

$\frac{\Delta\rho}{\rho} = \frac{\Delta m}{m} - \frac{\Delta V}{V}$

Errors are always added, Error in the density ρ will be

$= \left[\frac{\Delta m}{m} + \frac{\Delta V}{V}\right]\times 100\%$

$= \left[\frac{0.01}{22.42} + \frac{0.1}{4.7}\right]\times 100\% = 2\%$

34. (a) : Permeability of free space

$$\mu_0 = \frac{2\pi \times \text{force} \times \text{distance}}{\text{current} \times \text{current} \times \text{length}}$$

Dimensional formula of $\mu_0 = \frac{[MLT^{-2}][L]}{[A][A][L]}$
$= [MLT^{-2}A^{-2}]$

35. **(d) :** $f = am^xk^y$ ....(i)

Dimensions of frequency $f = [M^0L^0T^{-1}]$

Dimensions of constant $a = [M^0L^0T^0]$

Dimensions of mass $m = [M]$

Dimensions of spring constant $k = [MT^{-2}]$

Putting these value in equation (i), we get

$$[M^0L^0T^{-1}] = [M]^x[MT^{-2}]^y$$

Applying principle of homogeneity of dimensions, we get

$$x + y = 0 \quad \text{....(ii)}$$

$$2y = 1 \quad \text{....(iii)}$$

or $y = \frac{1}{2}, x = -\frac{1}{2}$

36. **(d) :** Dimensions of force $F = [MLT^{-2}]$

Dimensions of velocity gradient $\frac{\Delta v}{\Delta Z} = \frac{[LT^{-1}]}{[L]} = [T^{-1}]$

Dimensions of area $A = [L^2]$

Given $F = \eta A \frac{\Delta v}{\Delta Z}$

Dimensional formula for coefficient of viscocity

$$\eta = \frac{F}{(A)\left(\frac{\Delta v}{\Delta Z}\right)} = \frac{[MLT^{-2}]}{[L^2][T^{-1}]} = [ML^{-1}T^{-1}]$$

37. **(c) :** Units of $b = \frac{x}{t^2} = \frac{km}{s^2}$

38. **(d) :** Dimensions of energy $E = [ML^2T^{-2}]$

Dimensions of volume $v = [L^3]$

Dimensions of force $F = [MLT^{-2}]$

Dimensions of area $A = [L^2]$

Dimensions of voltage $V = [ML^2T^{-3}A^{-1}]$

Dimensions of charge $q = [AT]$

Dimensions of angular momentum $L = [ML^2T^{-1}]$

$\therefore$ Dimensions of $\frac{E}{v} = \frac{[ML^2T^{-2}]}{[L^3]} = [ML^{-1}T^{-2}]$

Dimensions of $\frac{F}{A} = \frac{[MLT^{-2}]}{[L^2]} = [ML^{-1}T^{-2}]$

Dimensions of $\frac{Vq}{v} = \frac{[ML^2T^{-3}A^{-1}][AT]}{[L^3]} = [ML^{-1}T^{-2}]$

Dimensions of angular momentum is $[ML^2T^{-1}]$ while other three has dimensions $[ML^{-1}T^{-2}]$

39. **(c) :** Induced emf $|\varepsilon| = L\frac{dI}{dt}$

where L is the self inductance and $\frac{dI}{dt}$ is the rate of change of current.

$\therefore$ Dimensional formula of $L = \frac{|\varepsilon|}{\frac{dI}{dt}}$

$$= \frac{[ML^2T^{-3}A^{-1}]}{[AT^{-1}]} = [ML^2A^{-2}T^{-2}]$$

40. **(a) :** Torque (τ) = Force $\times$ distance

Dimensional formula for $(\tau) = [MLT^{-2}][L] = [ML^2T^{-2}]$

41. **(a) :** Capacitance $C = \frac{\text{charge}}{\text{Potential difference}}$

Dimensions of $C = \frac{[AT]}{[ML^2T^{-3}A^{-1}]} = [M^{-1}L^{-2}T^4A^2]$

Resistance $R = \frac{\text{Potential difference}}{\text{current}}$

$$= \frac{[ML^2T^{-3}A^{-1}]}{[A]} = [ML^2T^{-3}A^{-2}]$$

Dimensional formula of CR

$$= [M^{-1}L^{-2}T^4A^2][ML^2T^{-3}A^{-2}] = [T]$$

As the (CR) has dimensions of time and so is called time constant of CR circuit.

42. **(d) :** Angular momentum L

= Moment of inertia I $\times$ Angular velocity ω

$\therefore$ Dimensional formula $L = [ML^2][T^{-1}] = [ML^2T^{-1}]$

CHAPTER

2 Motion in a Straight Line

1. A particle of unit mass undergoes one-dimensional motion such that its velocity varies according to $v(x) = \beta x^{-2n}$, where β and n are constants and x is the position of the particle. The acceleration of the particle as a function of x, is given by
   (a) $-2\beta^2 x^{-2n+1}$ (b) $-2n\beta^2 e^{-4n+1}$
   (c) $-2n\beta^2 x^{-2n-1}$ (d) $-2n\beta^2 x^{-4n-1}$
   (AIPMT 2015, Cancelled)

2. A stone falls freely under gravity. It covers distances h_1, h_2 and h_3 in the first 5 seconds, the next 5 seconds and the next 5 seconds respectively. The relation between h_1, h_2 and h_3 is
   (a) $h_2 = 3h_1$ and $h_3 = 3h_2$
   (b) $h_1 = h_2 = h_3$ (c) $h_1 = 2h_2 = 3h_3$
   (d) $h_1 = \frac{h_2}{3} = \frac{h_3}{5}$ *(NEET 2013)*

3. The displacement 'x' (in meter) of a particle of mass 'm' (in kg) moving in one dimension under the action of a force, is related to time 't' (in sec) by $t = \sqrt{x} + 3$. The displacement of the particle when its velocity is zero, will be
   (a) 4 m (b) 0 m (zero)
   (c) 6 m (d) 2 m
   (Karnataka NEET 2013)

4. The motion of a particle along a straight line is described by equation $x = 8 + 12t - t^3$ where x is in metre and t in second. The retardation of the particle when its velocity becomes zero is
   (a) 24 m s^{-2} (b) zero
   (c) 6 m s^{-2} (d) 12 m s^{-2}
   (Prelims 2012)

5. A boy standing at the top of a tower of 20 m height drops a stone. Assuming $g = 10$ m s^{-2}, the velocity with which it hits the ground is
   (a) 10.0 m/s (b) 20.0 m/s
   (c) 40.0 m/s (d) 5.0 m/s
   (Prelims 2011)

6. A particle covers half of its total distance with speed v_1 and the rest half distance with speed v_2. Its average speed during the complete journey is
   (a) $\frac{v_1 + v_2}{2}$ (b) $\frac{v_1v_2}{v_1 + v_2}$
   (c) $\frac{2v_1v_2}{v_1 + v_2}$ (d) $\frac{v_1^2v_2^2}{v_1^2 + v_2^2}$
   (Mains 2011)

7. A particle moves a distance x in time t according to equation $x = (t + 5)^{-1}$. The acceleration of particle is proportional to
   (a) (velocity)$^{3/2}$ (b) (distance)^2
   (c) (distance)$^{-2}$ (d) (velocity)$^{2/3}$
   (Prelims 2010)

8. A ball is dropped from a high rise platform at $t = 0$ starting from rest. After 6 seconds another ball is thrown downwards from the same platform with a speed v. The two balls meet at $t = 18$ s. What is the value of v?
   (Take $g = 10$ m/s^2)
   (a) 75 m/s (b) 55 m/s
   (c) 40 m/s (d) 60 m/s
   (Prelims 2010)

9. A particle starts its motion from rest under the action of a constant force. If the distance covered in first
   10 seconds is S_1 and that covered in the first 20 seconds is S_2, then
   (a) $S_2 = 3S_1$ (b) $S_2 = 4S_1$
   (c) $S_2 = S_1$ (d) $S_2 = 2S_1$
   (Prelims 2009)

10. A bus is moving with a speed of 10 ms^{-1} on a straight road. A scooterist wishes to overtake the bus in 100 s. If the bus is at a distance of 1 km from the scooterist, with what speed should the scooterist chase the bus?

(a) $40\ ms^{-1}$ (b) $25\ ms^{-1}$
(c) $10\ ms^{-1}$ (d) $20\ ms^{-1}$
(Prelims 2009)

11. A particle moves in a straight line with a constant acceleration. It changes its velocity from $10\ ms^{-1}$ to $20\ ms^{-1}$ while passing through a distance 135 m in t second. The value of t is
(a) 12 (b) 9
(c) 10 (d) 1.8 *(Prelims 2008)*

12. The distance travelled by a particle starting from rest and moving with an acceleration $\frac{4}{3}\ ms^{-2}$, in the third second is
(a) $\frac{10}{3}$ m (b) $\frac{19}{3}$ m
(c) 6 m (d) 4 m
(Prelims 2008)

13. A particle moving along x-axis has acceleration f, at time t, given by $f = f_0\left(1 - \frac{t}{T}\right)$, where f_0 and T are constants. The particle at $t = 0$ has zero velocity. In the time interval between $t = 0$ and the instant when $f = 0$, the particle's velocity (v_x) is
(a) $\frac{1}{2} f_0T^2$ (b) f_0T^2
(c) $\frac{1}{2} f_0T$ (d) f_0T *(2007)*

14. A car moves from X to Y with a uniform speed v_u and returns to Y with a uniform speed v_d. The average speed for this round trip is
(a) $\sqrt{v_u v_d}$ (b) $\frac{v_d v_u}{v_d + v_u}$
(c) $\frac{v_u + v_d}{2}$ (d) $\frac{2v_d v_u}{v_d + v_u}$ *(2007)*

15. The position x of a particle with respect to time t along x-axis is given by $x = 9t^2 - t^3$ where x is in metres and t in seconds. What will be the position of this particle when it achieves maximum speed along the $+x$ direction?
(a) 54 m (b) 81 m
(c) 24 m (d) 32 m. *(2007)*

16. Two bodies A (of mass 1 kg) and B (of mass 3 kg) are dropped from heights of 16 m and 25 m, respectively. The ratio of the time taken by them to reach the ground is
(a) 4/5 (b) 5/4
(c) 12/5 (d) 5/12. *(2006)*

17. A car runs at a constant speed on a circular track of radius 100 m, taking 62.8 seconds for every circular lap. The average velocity and average speed for each circular lap respectively is
(a) 10 m/s, 0 (b) 0, 0
(c) 0, 10 m/s (d) 10 m/s, 10 m/s.
(2006)

18. A particle moves along a straight line OX. At a time t (in seconds) the distance x (in metres) of the particle from O is given by $x = 40 + 12t - t^3$. How long would the particle travel before coming to rest?
(a) 16 m (b) 24 m
(c) 40 m (d) 56 m. *(2006)*

19. A ball is thrown vertically upward. It has a speed of 10 m/sec when it has reached one half of its maximum height. How high does the ball rise? Take $g = 10\ m/s^2$.
(a) 10 m (b) 5 m
(c) 15 m (d) 20 m. *(2005)*

20. The displacement x of a particle varies with time t as $x = ae^{-\alpha t} - be^{\beta t}$, where a, b, α and β are positive constants. The velocity of the particle will
(a) be independent of β
(b) drop to zero when $\alpha = \beta$
(c) go on decreasing with time
(d) go on increasing with time. *(2005)*

21. A man throws balls with the same speed vertically upwards one after the other at an interval of 2 seconds. What should be the speed of the throw so that more than two balls are in the sky at any time? (Given $g = 9.8\ m/s^2$)
(a) more than 19.6 m/s (b) at least 9.8 m/s
(c) any speed less than 19.6 m/s
(d) only with speed 19.6 m/s.
(2003)

22. If a ball is thrown vertically upwards with speed u, the distance covered during the last t seconds of its ascent is
(a) ut (b) $\frac{1}{2}gt^2$
(c) $ut - \frac{1}{2}gt^2$ (d) $(u + gt)t$. *(2003)*

23. A particle is thrown vertically upward. Its velocity at half of the height is 10 m/s, then the maximum height attained by it ($g = 10\ m/s^2$)
(a) 8 m (b) 20 m
(c) 10 m (d) 16 m. *(2001)*

24. Motion of a particle is given by equation $s = (3t^3 + 7t^2 + 14t + 8)$ m. The value of acceleration of the particle at $t = 1$ sec is
(a) $10\ m/s^2$ (b) $32\ m/s^2$
(c) $23\ m/s^2$ (d) $16\ m/s^2$. *(2000)*

25. A car moving with a speed of 40 km/h can be stopped by applying brakes after at least 2 m. If the same car is moving with a speed of 80 km/h, what is the minimum stopping distance?
(a) 4 m (b) 6 m
(c) 8 m (d) 2 m. *(1998)*

26. A rubber ball is dropped from a height of 5 m on a plane. On bouncing it rises to 1.8 m. The ball loses its velocity on bouncing by a factor of
(a) $\frac{3}{5}$ (b) $\frac{2}{5}$ (c) $\frac{16}{25}$ (d) $\frac{9}{25}$.
(1998)

27. The position x of a particle varies with time, (t) as $x = at^2 - bt^3$. The acceleration will be zero at time t is equal to
(a) $\frac{a}{3b}$ (b) zero (c) $\frac{2a}{3b}$ (d) $\frac{a}{b}$.
(1997)

28. If a car at rest accelerates uniformly to a speed of 144 km/h in 20 sec, it covers a distance of
(a) 1440 cm (b) 2980 cm
(c) 20 m (d) 400 m. *(1997)*

29. A body dropped from a height h with initial velocity zero, strikes the ground with a velocity 3 m/s. Another body of same mass dropped from the same height h with an initial velocity of 4 m/s. The final velocity of second mass, with which it strikes the ground is
(a) 5 m/s (b) 12 m/s
(c) 3 m/s (d) 4 m/s. *(1996)*

30. The acceleration of a particle is increasing linearly with time t as bt. The particle starts from origin with an initial velocity v_0. The distance travelled by the particle in time t will be
(a) $v_0t + \frac{1}{3}bt^2$ (b) $v_0t + \frac{1}{2}bt^2$
(c) $v_0t + \frac{1}{6}bt^3$ (d) $v_0t + \frac{1}{3}bt^3$. *(1995)*

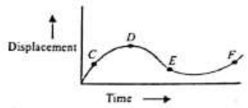
31. The water drop falls at regular intervals from a tap 5 m above the ground. The third drop is leaving the tap at instant the first drop touches the ground. How far above the ground is the second drop at that instant?
(a) 3.75 m (b) 4.00 m
(c) 1.25 m (d) 2.50 m. *(1995)*

32. A car accelerates from rest at a constant rate α for some time after which it decelerates at a constant rate β and comes to rest. If total time elapsed is t, then maximum velocity acquired by car will be
(a) $\frac{(\alpha^2 - \beta^2)t}{\alpha\beta}$ (b) $\frac{(\alpha^2 + \beta^2)t}{\alpha\beta}$
(c) $\frac{(\alpha + \beta)t}{\alpha\beta}$ (d) $\frac{\alpha\beta t}{\alpha + \beta}$. *(1994)*

33. A particle moves along a straight line such that its displacement at any time t is given by $s = (t^3 - 6t^2 + 3t + 4)$ metres. The velocity when the acceleration is zero is
(a) 3 m/s (b) 42 m/s
(c) -9 m/s (d) -15 m/s. *(1994)*

34. The velocity of train increases uniformly from 20 km/h to 60 km/h in 4 hours. The distance travelled by the train during this period is
(a) 160 km (b) 180 km
(c) 100 km (d) 120 km. *(1994)*

35. The displacement-time graph of a moving particle is shown below. The instantaneous velocity of the particle is negative at the point



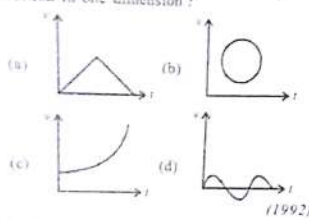
(a) E (b) F
(c) C (d) D. *(1994)*

36. A body starts from rest, what is the ratio of the distance travelled by the during the 4[th] and 3[rd] second?

(a) $\frac{7}{5}$ (b) $\frac{5}{7}$

(c) $\frac{7}{3}$ (d) $\frac{3}{7}$. *(1993)*

37. Which of the following curve does not represent motion in one dimension ?



(1992)

38. A body dropped from top of a tower fall through 40 m during the last two seconds of its fall. The height of tower is ($g = 10\ m/s^2$)

(a) 60 m (b) 45 m

(c) 80 m (d) 50 m. *(1992)*

39. A car moves a distance of 200 m. It covers the first half of the distance at speed 40 km/h and the second half of distance at speed v. The average speed is 48 km/h. The value of v is

(a) 56 km/h (b) 60 km/h

(c) 50 km/h (d) 48 km/h. *(1991)*

40. A bus travelling the first one-third distance at a speed of 10 km/h, the next one-third at 20 km/h and at last one-third at 60 km/h. The average speed of the bus is

(a) 9 km/h (b) 16 km/h

(c) 18 km/h (d) 48 km/h. *(1991)*

41. A car covers the first half of the distance between two places at 40 km/h and another half at 60 km/h. The average speed of the car is

(a) 40 km/h (b) 48 km/h

(c) 50 km/h (d) 60 km/h. *(1990)*

42. What will be the ratio of the distance moved by a freely falling body from rest in 4th and 5th seconds of journey ?

(a) 4 : 5 (b) 7 : 9

(c) 16 : 25 (d) 1 : 1. *(1989)*

43. A car is moving along a straight road with a uniform acceleration. It passes through two points P and Q separated by a distance with velocity 30 km/h and 40 km/h respectively. The velocity of the car midway between P and Q is

(a) 33.3 km/h (b) $20\sqrt{2}$ km/h

(c) $25\sqrt{2}$ km/h (d) 35 km/h. *(1988)*

EXPLANATIONS

1. **(d)** : According to question, velocity of unit mass varies as

$v(x) = \beta x^{-2n}$ ...(i)

$\frac{dv}{dx} = -2n\beta x^{-2n-1}$ ...(ii)

Acceleration of the particle is given by

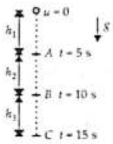
$a = \frac{dv}{dt} = \frac{dv}{dx} \times \frac{dx}{dt} = \frac{dv}{dx} \times v$

Using equation (i) and (ii), we get

$a = (-2n\beta x^{-2n-1}) \times (\beta x^{-2n})$

$= -2n\beta^2 x^{-4n-1}$

2. **(d)** : Distance covered by the stone in first 5 seconds (*i.e.* $t = 5$ s) is



$h_1 = \frac{1}{2}g(5)^2 = \frac{25}{2}g$ ...(i)

Distance travelled by the stone in next 5 seconds (*i.e.* $t = 10$ s) is

$h_1 + h_2 = \frac{1}{2}g(10)^2 = \frac{100}{2}g$ ...(ii)

Distance travelled by the stone in next 5 seconds (*i.e.* $t = 15$ s) is

$h_1 + h_2 + h_3 = \frac{1}{2}g(15)^2 = \frac{225}{2}g$ ...(iii)

Subtract (i) from (ii), we get

$(h_1 + h_2) - h_1 = \frac{100}{2}g - \frac{25}{2}g = \frac{75}{2}g$

$h_2 = \frac{75}{2}g = 3h_1$ ...(iv)

Subtract (ii) from (iii), we get

$(h_1 + h_2 + h_3) - (h_2 + h_1) = \frac{225}{2}g - \frac{100}{2}g$

$h_3 = \frac{125}{2}g = 5h_1$ ...(v)

From (i), (iv) and (v), we get

$h_1 = \frac{h_2}{3} = \frac{h_3}{5}$

3. **(b)** : Given : $t = \sqrt{x} + 3$

or $\sqrt{x} = t - 3$

Squaring both sides, we get

$x = (t-3)^2$

Velocity, $v = \frac{dx}{dt} = \frac{d}{dt}(t-3)^2 = 2(t-3)$

Velocity of the particle becomes zero, when

$2(t-3) = 0$ or $t = 3$ s

At $t = 3$ s,

$x = (3-3)^2 = 0$ m

4. **(d)** : Given : $x = 8 + 12t - t^3$

Velocity, $v = \frac{dx}{dt} = 12 - 3t^2$

When $v = 0$, $12 - 3t^2 = 0$ or $t = 2$ s

$a = \frac{dv}{dt} = -6t$

$a|_{t=2\,s} = -12\ m\ s^{-2}$

Retardation = $12\ m\ s^{-2}$

5. **(b)** : Here, $u = 0$, $g = 10\ m\ s^{-2}$, $h = 20$ m

Let v be the velocity with which the stone hits the ground.

$\therefore\ v^2 = u^2 + 2gh$

or $v = \sqrt{2gh} = \sqrt{2 \times 10 \times 20} = 20$ m/s ($\because\ u = 0$)

6. **(c)** : Let S be the total distance travelled by the particle.

Let t_1 be the time taken by the particle to cover first half of the distance. Then

$t_1 = \frac{S/2}{v_1} = \frac{S}{2v_1}$

Let t_2 be the time taken by the particle to cover remaining half of the distance. Then

$t_2 = \frac{S/2}{v_2} = \frac{S}{2v_2}$

Average speed, $v_{av} = \frac{\text{Total distance travelled}}{\text{Total time taken}}$

$= \frac{S}{t_1 + t_2} = \frac{S}{\frac{S}{2v_1} + \frac{S}{2v_2}} = \frac{2v_1 v_2}{v_1 + v_2}$

7. **(a)** : Distance, $x = (t+5)^{-1}$ ...(i)

Velocity, $v = \frac{dx}{dt} = \frac{d}{dt}(t+5)^{-1}$

$= -(t+5)^{-2}$ ...(ii)

Acceleration, $a = \frac{dv}{dt} = \frac{d}{dt}[-(t+5)^{-2}]$
$= 2(t+5)^{-3}$ ...(iii)

From equation (ii), we get
$v^{3/2} = -(t+5)^{-3}$ ...(iv)

Substituting this in equation (iii) we get
Acceleration, $a = -2v^{3/2}$
or $a \propto (\text{velocity})^{3/2}$

From equation (i), we get
$x^3 = (t+5)^{-3}$

Substituting this in equation (iii), we get
Acceleration, $a = 2x^3$
or $a \propto (\text{distance})^3$

Hence option (a) is correct.

8. (a) : Let the two balls meet after t s at distance x from the platform.

For the first ball
$u = 0, t = 18\text{ s}, g = 10\text{ m/s}^2$

Using $h = ut + \frac{1}{2}gt^2$

$\therefore \quad x = \frac{1}{2} \times 10 \times 18^2$ ...(i)

For the second ball
$u = v, t = 12\text{ s}, g = 10\text{ m/s}^2$

Using $h = ut + \frac{1}{2}gt^2$

$\therefore \quad x = v \times 12 + \frac{1}{2} \times 10 \times 12^2$ ...(ii)

From equations (i) and (ii), we get
$\frac{1}{2} \times 10 \times 18^2 = 12v + \frac{1}{2} \times 10 \times (12)^2$

or $12v = \frac{1}{2} \times 10 \times [(18)^2 - (12)^2]$
$= \frac{1}{2} \times 10 \times [(18+12)(18-12)]$

$12v = \frac{1}{2} \times 10 \times 30 \times 6$

or $v = \frac{1 \times 10 \times 30 \times 6}{2 \times 12} = 75\text{ m/s}$

9. (b) : Given $u = 0$

Distance travelled in 10 s, $S_1 = \frac{1}{2}a \cdot 10^2 = 50a$

Distance travelled in 20 s, $S_2 = \frac{1}{2}a \cdot 20^2 = 200a$

$\therefore \quad S_2 = 4S_1$.

10. (d) : Let v_s be the velocity of the scooter, the distance between the scooter and the bus = 1000 m,
The velocity of the bus = 10 ms^{-1}
Time taken to overtake = 100 s
Relative velocity of the scooter with respect to the bus = $(v_s - 10)$

$\therefore \frac{1000}{(v_s - 10)} = 100\text{ s} \Rightarrow v_s = 20\text{ ms}^{-1}$.

11. (b) : $v^2 - u^2 = 2as$

Given $v = 20\text{ ms}^{-1}, u = 10\text{ ms}^{-1}, s = 135\text{ m}$

$\therefore \quad a = \frac{400-100}{2 \times 135} = \frac{300}{270} = \frac{10}{9}\text{ m/s}^2$

$v = u + at \Rightarrow t = \frac{v-u}{a} = \frac{10\text{ m/s}}{\frac{10}{9}\text{ m/s}^2} = 9\text{ s}$

12. (a) : Distance travelled in the 3[rd] second
= Distance travelled in 3 s
− distance travelled in 2 s.

As, $u = 0$,

$S_{(3^{rd}\ s)} = \frac{1}{2}a \cdot 3^2 - \frac{1}{2}a \cdot 2^2 = \frac{1}{2} \cdot a \cdot 5$

Given $a = \frac{4}{3}\text{ ms}^{-2}$; $\therefore \quad S_{(3^{rd}\ s)} = \frac{1}{2} \times \frac{4}{3} \times 5 = \frac{10}{3}\text{ m}$

13. (c) : Given : At time $t = 0$, velocity, $v = 0$.

Acceleration $f = f_0\left(1 - \frac{t}{T}\right)$

At $f = 0$, $\quad 0 = f_0\left(1 - \frac{t}{T}\right)$

Since f_0 is a constant,

$\therefore \quad 1 - \frac{t}{T} = 0$ or $t = T$.

Also, acceleration $f = \frac{dv}{dt}$

$\therefore \quad \int_0^{v_x} dv = \int_{t=0}^{t=T} f dt = \int_0^T f_0\left(1 - \frac{t}{T}\right)dt$

$\therefore \quad v_x = \left[f_0 t - \frac{f_0 t^2}{2T}\right]_0^T = f_0 T - \frac{f_0 T^2}{2T} = \frac{1}{2}f_0 T$.

14. (d) : Average speed = $\frac{\text{total distance travelled}}{\text{total time taken}}$

$= \frac{s+s}{t_1+t_2} = \frac{2s}{\frac{s}{v_u} + \frac{s}{v_d}} = \frac{2v_u v_d}{v_d + v_u}$

15. (a) : Given : $x = 9t^2 - t^3$ ... (i)

Speed $v = \frac{dx}{dt} = \frac{d}{dt}(9t^2 - t^3) = 18t - 3t^2$.

For maximum speed, $\frac{dv}{dt} = 0 \Rightarrow 18 - 6t = 0$

$\therefore \quad t = 3$ s.
$\therefore \quad x_{max} = 81\text{ m} - 27\text{ m} = 54\text{ m}$.
(From $x = 9t^2 - t^3$).

16. (a) : Time taken by a body fall from a height h to reach the ground is $t = \sqrt{\frac{2h}{g}}$.

$\therefore \quad \frac{t_A}{t_B} = \frac{\sqrt{\frac{2h_A}{g}}}{\sqrt{\frac{2h_B}{g}}} = \sqrt{\frac{h_A}{h_B}} = \sqrt{\frac{16}{25}} = \frac{4}{5}$.

17. (c) : Distance travelled in one rotation (lap) = $2\pi r$

$\therefore \quad$ Average speed = $\frac{\text{distance}}{\text{time}} = \frac{2\pi r}{t}$

$= \frac{2 \times 3.14 \times 100}{62.8} = 10\text{ m s}^{-1}$

Net displacement in one lap = 0

Average velocity = $\frac{\text{net displacement}}{\text{time}} = \frac{0}{t} = 0$.

18. (a) : $x = 40 + 12t - t^3$

$\therefore \quad$ Velocity $v = \frac{dx}{dt} = 12 - 3t^2$

When particle come to rest, $dx/dt = v = 0$
$\therefore \quad 12 - 3t^2 = 0 \Rightarrow 3t^2 = 12 \Rightarrow t = 2$ sec.

Distance travelled by the particle before coming to rest

$\int_0^s ds = \int_0^2 v dt \qquad s = \int_0^2 (12 - 3t^2)dt = 12t - \frac{3t^3}{3}\Big|_0^2$

$s = 12 \times 2 - 8 = 24 - 8 = 16$ m.

19. (a) : $v^2 = u^2 - 2gh$

After reaching maximum height velocity becomes zero.

$0 = (10)^2 - 2 \times 10 \times \frac{h}{2} \qquad \therefore h = \frac{200}{20} = 10\text{ m}$.

20. (d) : $x = ae^{-\alpha t} + be^{\beta t}$

$\frac{dx}{dt} = -a\alpha e^{-\alpha t} + b\beta e^{\beta t}$

$v = -a\alpha e^{-\alpha t} + b\beta e^{\beta t}$

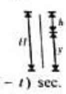
For certain value of t, velocity will increases.

21. (a) : Interval of ball thrown = 2 sec

If we want that minimum three (more than two) balls remain in air then time of flight of first ball must be greater than 4 sec.

$T > 4\text{ sec}$ or $\frac{2u}{g} > 4\text{ sec} \Rightarrow u > 19.6\text{ m/s}$.

22. (b) : Let total height = H
Time of ascent = T



So, $H = uT - \frac{1}{2}gT^2$

Distance covered by ball in time $(T - t)$ sec.

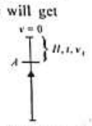
$y = u(T - t) - \frac{1}{2}g(T - t)^2$

So distance covered by ball in last t sec.

$h = H - y = \left[uT - \frac{1}{2}gT^2\right] - \left[u(T-t) - \frac{1}{2}g(T-t)^2\right]$

By solving and putting $T = \frac{u}{g}$ we will get

$h = \frac{1}{2}gt^2$.



Aliter :

Time to reach the topmost position,
$T = u/g$
Velocity at the top, $v = 0$

Let's consider a point A distance H below the highest point. Let it takes t seconds for the ball to reach the top from A. So we have to calculate H. Let's find the velocity at point A. Now the time taken to reach A is $(T - t)$.

$\therefore \quad v_A = u - g(T - t) = u - gT - gt = u - u - gt = -gt$.

Now consider its journey from A to the top.
Using $v^2 = u^2 - 2gh$

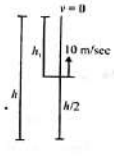
$\Rightarrow \quad 0 = v_A{}^2 - 2gH \Rightarrow H = \frac{(-gt)^2}{2g} = \frac{1}{2}gt^2$.

23. (c) : For half height,

$10^2 = u^2 - 2g\frac{h}{2}$ ...(i)

For total height,
$0 = u^2 - 2gh$ ...(ii)
From (i) and (ii)

$\Rightarrow \quad 10^2 = \frac{2gh}{2} \Rightarrow h = 10$ m.



24. (b) : $\frac{ds}{dt} = 9t^2 + 14t + 14$

$\Rightarrow \quad \frac{d^2s}{dt^2} = 18t + 14 = a$

$a_{t=1} = 18 \times 1 + 14 = 32\text{ m/s}^2$

25. (c) : 1st case $v^2 - u^2 = 2as$

$0 - \left(\frac{100}{9}\right)^2 = 2 \times a \times 2 \qquad$ [40 km/h = 100/9 m/s]

$a = -\frac{10^4}{81 \times 4}$ m/s

2nd case : $0-\left(\frac{200}{9}\right)^2 = 2\times\left(-\frac{10^4}{81\times 4}\right)\times s$

[80 km/h = $200/9$ m/s]

or $s = 8$ m.

26. (a) : Initial energy equation

$mgh = \frac{1}{2}mv^2$ i.e. $10\times 5 = \frac{1}{2}v_1^2 \Rightarrow v_1 = 10$ ...(i)

After one bounce, $10\times 1.8 = \frac{1}{2}v_2^2 \Rightarrow v_2 = 6$ ...(ii)

Loss its velocity on bouncing $\frac{6}{10} = \frac{3}{5}$ a factor.

27. (a) : Distance $(x) = at^2 - bt^3$.

Therefore velocity $(v) = \frac{dx}{dt} = \frac{d}{dt}\left(at^2 - bt^3\right)$

$= 2at - 3bt^2$ and

acceleration $= \frac{dv}{dt} = \frac{d}{dt}\left(2at - 3bt^2\right) = 2a - 6bt = 0$

or $t = \frac{2a}{6b} = \frac{a}{3b}$.

28. (d) : Initial velocity $u = 0$,
Final velocity = 144 km/h = 40 m/s and time = 20 sec.
Using $v = u + at \Rightarrow a = v/t = 2$ m/s^2

Again, $s = ut + \frac{1}{2}at^2 = \frac{1}{2}\times 2\times(20)^2 = 400$ m.

29. (a) : Initial velocity of first body $(u_1) = 0$;
Final velocity $(v_1) = 3$ m/s and initial velocity of second body $(u_2) = 4$ m/s.

height $(h) = \frac{v_1^2}{2g} = \frac{(3)^2}{2\times 9.8} = 0.46$ m.

Therefore velocity of the second body,

$v_2 = \sqrt{u_2^2 + 2gh} = \sqrt{(4)^2 + 2\times 9.8\times 0.46} = 5$ m/s.

30. (c) : Acceleration $\propto bt$, i.e., $\frac{d^2x}{dt^2} = a \propto bt$

Integrating, $\frac{dx}{dt} = \frac{bt^2}{2} + C$

Initially, $t = 0$, $dx/dt = v_0$

Therefore, $\frac{dx}{dt} = \frac{bt^2}{2} + v_0$

Integrating again, $x = \frac{bt^3}{6} + v_0 t + C$

When $t = 0, x = 0 \Rightarrow C = 0$.

i.e., distance travelled by the particle in time t

$= v_0 t + \frac{bt^3}{6}$.

31. (a) : Height of tap = 5 m. For the first drop,

$5 = ut + \frac{1}{2}gt^2 = \frac{1}{2}\times 10t^2 = 5t^2$ or $t^2 = 1$

or $t = 1$ sec. It means that the third drop leaves after one second of the first drop, or each drop leaves after every 0.5 sec. Distance covered by the second drop in 0.5 sec

$= \frac{1}{2}gt^2 = \frac{1}{2}\times 10\times(0.5)^2 = 1.25$ m.

Therefore distance of the second drop above the ground = 5 – 1.25 = 3.75 m.

32. (d) : Initial velocity $(u) = 0$; Acceleration in the first phase = α; Deceleration in the second phase = β and total time = t.

When car is accelerating then
final velocity $(v) = u + \alpha t = 0 + \alpha t_1$

or $t_1 = \frac{v}{\alpha}$ and when car is decelerating,

then final velocity $0 = v - \beta t$ or $t_2 = \frac{v}{\beta}$.

Therefore total time $(t) = t_1 + t_2 = \frac{v}{\alpha} + \frac{v}{\beta}$

$t = v\left(\frac{1}{\alpha} + \frac{1}{\beta}\right) = v\left(\frac{\beta+\alpha}{\alpha\beta}\right)$ or $v = \frac{\alpha\beta t}{\alpha+\beta}$.

33. (c) : Displacement $(s) = t^3 - 6t^2 + 3t + 4$ metres.

velocity $(v) = \frac{ds}{dt} = 3t^2 - 12t + 3$

acceleration $(a) = \frac{dv}{dt} = 6t - 12$.

When $a = 0$, we get $t = 2$ seconds.

Therefore velocity when the acceleration is zero $(v) = 3\times(2)^2 - (12\times 2) + 3 = -9$ m/s.

34. (a) : Initial velocity $(u) = 20$ km/h; Final velocity (v) = 60 km/h and time $(t) = 4$ hours.

velocity $(v) = 60 = u + at = 20 + (a\times 4)$

or, $a = \frac{60-20}{4} = 10$ km/h^2.

Therefore distance travelled in 4 hours is s

$s = ut + \frac{1}{2}at^2 = (20\times 4) + \frac{1}{2}\times 10\times(4)^2 = 160$ km.

35. (a) : The velocity $(v) = \frac{ds}{dt}$.

Therefore, instantaneous velocity at point E is negative.

36. (a) : Distance covered in n^{th} second is given by

$$s_n = u + \frac{a}{2}(2n-1)$$

Here, $u = 0$

$\therefore\ s_4 = 0 + \frac{a}{2}(2\times 4 - 1) = \frac{7a}{2}$

$s_3 = 0 + \frac{a}{2}(2\times 3 - 1) = \frac{5a}{2}$ $\therefore\ \frac{s_4}{s_3} = \frac{7}{5}$

37. (b) : In one dimensional motion, the body can have at a time one value of velocity but not two values of velocities.

38. (b) : Let h be height of the tower and t is the time taken by the body to reach the ground.

Here, $u = 0$, $a = g$

$\therefore\ h = ut + \frac{1}{2}gt^2$ or $h = 0\times t + \frac{1}{2}gt^2$

or $h = \frac{1}{2}gt^2$ .....(i)

Distance covered in last two seconds is

$40 = \frac{1}{2}gt^2 - \frac{1}{2}g(t-2)^2$ (Here, $u = 0$)

or $40 = \frac{1}{2}gt^2 - \frac{1}{2}g(t^2 + 4 - 4t)$

or $40 = (2t-2)g$ or $t = 3$ s

From eqn (i), we get $h = \frac{1}{2}\times 10\times(3)^2$ or $h = 45$ m

39. (b) : Total distance travelled = 200 m

Total time taken $= \frac{100}{40} + \frac{100}{v}$

Average speed $= \frac{\text{total distance travelled}}{\text{total time taken}}$

$48 = \frac{200}{\left(\frac{100}{40} + \frac{100}{v}\right)}$ or $48 = \frac{2}{\left(\frac{1}{40} + \frac{1}{v}\right)}$

or $\frac{1}{40} + \frac{1}{v} = \frac{1}{24}$

or $\frac{1}{v} = \frac{1}{24} - \frac{1}{40} = \frac{5-3}{120} = \frac{1}{60}$

or $v = 60$ km/hr

40. (c) : Total distance travelled = s

Total time taken $= \frac{s/3}{10} + \frac{s/3}{20} + \frac{s/3}{60}$

$= \frac{s}{30} + \frac{s}{60} + \frac{s}{180} = \frac{10s}{180} = \frac{s}{18}$

Average speed $= \frac{\text{total distance travelled}}{\text{total time taken}}$

$= \frac{s}{s/18} = 18$ km/hr.

41. (b) : Total distance covered = s

Total time taken $= \frac{s/2}{40} + \frac{s/3}{60} = \frac{5s}{240} = \frac{s}{48}$

$\therefore$ Average speed $= \frac{\text{total distance covered}}{\text{total time taken}}$

$= \frac{s}{\left(\frac{s}{48}\right)} = 48$ km/hr

42. (b) : Distance covered in n^{th} second is given by

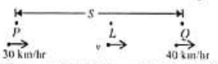
$$s_n = u + \frac{a}{2}(2n-1)$$

Given : $u = 0$, $a = g$

$\therefore\ s_4 = \frac{g}{2}(2\times 4 - 1) = \frac{7g}{2}$

$s_5 = \frac{g}{2}(2\times 5 - 1) = \frac{9g}{2}$ $\therefore\ \frac{s_4}{s_5} = \frac{7}{9}$

43. (c) :



Let $PQ = s$ and L is the midpoint of PQ and v be velocity of the car at point L.

Using third equation of motion, we get

$(40)^2 - (30)^2 = 2as$

or $a = \frac{(40)^2 - (30)^2}{2s} = \frac{350}{s}$ .....(i)

Also, $v^2 - (30)^2 = 2a\frac{s}{2}$

or $v^2 - (30)^2 = 2\times\frac{350}{s}\times\frac{s}{2}$ [Using (i)]

or $v = 25\sqrt{2}$ km/hr

CHAPTER 3

Motion in a Plane

1. If vectors $\vec{A} = \cos\omega t\,\hat{i} + \sin\omega t\,\hat{j}$ and $\vec{B} = \cos\frac{\omega t}{2}\hat{i} + \sin\frac{\omega t}{2}\hat{j}$ are functions of time, then the value of t at which they are orthogonal to each other is
   (a) $t = \frac{\pi}{\omega}$ (b) $t = 0$
   (c) $t = \frac{\pi}{4\omega}$ (d) $t = \frac{\pi}{2\omega}$
   (AIPMT 2015)

2. The position vector of a particle $\vec{R}$ as a function of time is given by $\vec{R} = 4\sin(2\pi t)\hat{i} + 4\cos(2\pi t)\hat{j}$ Where R is in meters, t is in seconds and $\hat{i}$ and $\hat{j}$ denote unit vectors along x-and y-directions, respectively. Which one of the following statements is wrong for the motion of particle?
   (a) Magnitude of the velocity of particle is 8 meter/second
   (b) Path of the particle is a circle of radius 4 meter.
   (c) Acceleration vector is along $-\vec{R}$.
   (d) Magnitude of acceleration vector is $\frac{v^2}{R}$, where v is the velocity of particle.
   (AIPMT 2015)

3. A ship A is moving Westwards with a speed of 10 km h^{-1} and a ship B 100 km South of A, is moving Northwards with a speed of 10 km h^{-1}. The time after which the distance between them becomes shortest, is
   (a) $5\sqrt{2}$ h (b) $10\sqrt{2}$ h
   (c) 0 h (d) 5 h
   (AIPMT 2015, Cancelled)

4. A projectile is fired from the surface of the earth with a velocity of 5 m s^{-1} and angle θ with the horizontal. Another projectile fired from another planet with a velocity of 3 m s^{-1} at the same angle follows a trajectory which is identical with the trajectory of the projectile fired from the earth. The value of the acceleration due to gravity on the planet is (in m s^{-2}) is (Given $g = 9.8$ m s^{-2})
   (a) 3.5 (b) 5.9
   (c) 16.3 (d) 110.8
   (AIPMT 2014)

5. A particle is moving such that its position coordinates (x, y) are (2 m, 3 m) at time $t = 0$, (6 m, 7 m) at time $t = 2$ s and (13 m, 14 m) at time $t = 5$ s.
   Average velocity vector $(\vec{v}_{av})$ from $t = 0$ to $t = 5$ s is
   (a) $\frac{1}{5}(13\hat{i} + 14\hat{j})$ (b) $\frac{7}{3}(\hat{i} + \hat{j})$
   (c) $2(\hat{i} + \hat{j})$ (d) $\frac{11}{5}(\hat{i} + \hat{j})$
   (AIPMT 2014)

6. The velocity of a projectile at the initial point A is $(2\hat{i} + 3\hat{j})$ m/s. It's velocity (in m/s) at point B is

   (a) $2\hat{i} - 3\hat{j}$
   (b) $2\hat{i} + 3\hat{j}$
   (c) $-2\hat{i} - 3\hat{j}$
   (d) $-2\hat{i} + 3\hat{j}$
   (NEET 2013)

7. Vectors $\vec{A}$, $\vec{B}$ and $\vec{C}$ are such that $\vec{A}\cdot\vec{B} = 0$ and $\vec{A}\cdot\vec{C} = 0$. Then the vector parallel to $\vec{A}$ is
   (a) $\vec{A}\times\vec{B}$ (b) $\vec{B}+\vec{C}$
   (c) $\vec{B}\times\vec{C}$ (d) $\vec{B}$ and $\vec{C}$
   (Karnataka NEET 2013)

8. The horizontal range and the maximum height of a projectile are equal. The angle of projection of the projectile is

   (a) $\theta = \tan^{-1}\left(\frac{1}{4}\right)$ (b) $\theta = \tan^{-1}(4)$
   (c) $\theta = \tan^{-1}(2)$ (d) $\theta = 45°$
   (Prelims 2012)

9. A particle has initial velocity $(2\vec{i} + 3\vec{j})$ and acceleration $(0.3\vec{i} + 0.2\vec{j})$. The magnitude of velocity after 10 seconds will be
   (a) $9\sqrt{2}$ units (b) $5\sqrt{2}$ units
   (c) 5 units (d) 9 units
   (Prelims 2012)

10. A particle moves in a circle of radius 5 cm with constant speed and time period 0.2π s. The acceleration of the particle is
    (a) 15 m/s^2 (b) 25 m/s^2
    (c) 36 m/s^2 (d) 5 m/s^2
    (Prelims 2011)

11. A missile is fired for maximum range with an initial velocity of 20 m/s. If $g = 10$ m/s^2, the range of the missile is
    (a) 40 m (b) 50 m
    (c) 60 m (d) 20 m
    (Prelims 2011)

12. A body is moving with velocity 30 m/s towards east. After 10 seconds its velocity becomes 40 m/s towards north. The average acceleration of the body is
    (a) 1 m/s^2 (b) 7 m/s^2
    (c) $\sqrt{7}$ m/s^2 (d) 5 m/s^2
    (Prelims 2011)

13. A projectile is fired at an angle of 45° with the horizontal. Elevation angle of the projectile at its highest point as seen from the point of projection, is
    (a) 45° (b) 60°
    (c) $\tan^{-1}\frac{1}{2}$ (d) $\tan^{-1}\left(\frac{\sqrt{3}}{2}\right)$
    (Mains 2011)

14. A particle has initial velocity $(3\hat{i} + 4\hat{j})$ and has acceleration $(0.4\hat{i} + 0.3\hat{j})$. Its speed after 10 s is
    (a) 7 units (b) $7\sqrt{2}$ units
    (c) 8.5 units (d) 10 units
    (Prelims 2010)

15. Six vectors, $\vec{a}$ through $\vec{f}$ have the magnitudes and directions indicated in the figure. Which of the following statements is true?
    (a) $\vec{b} + \vec{c} = \vec{f}$
    (b) $\vec{d} + \vec{c} = \vec{f}$
    (c) $\vec{d} + \vec{e} = \vec{f}$
    (d) $\vec{b} + \vec{e} = \vec{f}$

    (Prelims 2010)

16. The speed of a projectile at its maximum height is half of its initial speed. The angle of projection is
    (a) 60° (b) 15°
    (c) 30° (d) 45° *(Mains 2010)*

17. A particle moves in x-y plane according to rule $x = a\sin\omega t$ and $y = a\cos\omega t$. The particle follows
    (a) an elliptical path (b) a circular path
    (c) a parabolic path
    (d) a straight line path inclined equally to x and y-axes
    (Mains 2010)

18. A particle shows distance - time curve as given in this figure. The maximum instantaneous velocity of the particle is around the point
    (a) D
    (b) A
    (c) B
    (d) C

    (Prelims 2008)

19. A particle of mass m is projected with velocity v making an angle of 45° with the horizontal. When the particle lands on the level ground the magnitude of the change in its momentum will be
    (a) $mv\sqrt{2}$ (b) zero
    (c) $2mv$ (d) $mv/\sqrt{2}$
    (Prelims 2008)

20. $\vec{A}$ and $\vec{B}$ are two vectors and θ is the angle between them, if $|\vec{A}\times\vec{B}| = \sqrt{3}(\vec{A}\cdot\vec{B})$, the value of θ is
    (a) 45° (b) 30°
    (c) 90° (d) 60°. *(2007)*

21. A particle starting from the origin (0, 0) moves in a straight line in the (x, y) plane. Its coordinates at a later time are $(\sqrt{3}, 3)$. The path of the particle makes with the x-axis an angle of
    (a) 45° (b) 60°
    (c) 0° (d) 30°. *(2007)*

22. A tube of length L is filled completely with an incompressible liquid of mass M and closed at both the ends. The tube is then rotated in a horizontal plane about one of its ends with a uniform angular velocity ω. The force exerted by the liquid at the other end is
(a) $\frac{ML^2\omega^2}{2}$ (b) $\frac{ML\omega^2}{2}$
(c) $\frac{ML^2\omega}{2}$ (d) $ML\omega^2$. *(2006)*

23. For angles of projection of a projectile at angle $(45° - \theta)$ and $(45° + \theta)$, the horizontal range described by the projectile are in the ratio of
(a) 2 : 1 (b) 1 : 1
(c) 2 : 3 (d) 1 : 2. *(2006)*

24. The vectors $\vec{A}$ and $\vec{B}$ are such that $|\vec{A}+\vec{B}| = |\vec{A}-\vec{B}|$. The angle between the two vectors is
(a) 45° (b) 90°
(c) 60° (d) 75°.
(2006, 1996, 91)

25. Two boys are standing at the ends A and B of a ground where $AB = a$. The boy at B starts running in a direction perpendicular to AB with velocity v_1. The boy at A starts running simultaneously with velocity v and catches the other in a time t, where t is
(a) $\frac{a}{\sqrt{v^2+v_1^2}}$ (b) $\frac{a}{v+v_1}$
(c) $\frac{a}{v-v_1}$ (d) $\sqrt{\frac{a^2}{v^2-v_1^2}}$ *(2005)*

26. A stone tied to the end of a string of 1 m long is whirled in a horizontal circle with a constant speed. If the stone makes 22 revolutions in 44 seconds, what is the magnitude and direction of acceleration of the stone?
(a) π^2 ms^{-2} and direction along the radius towards the centre
(b) π^2 ms^{-2} and direction along the radius away from the centre
(c) π ms^{-2} and direction along the tangent to the circle
(d) $\pi^2/4$ ms^{-2} and direction along the radius towards the centre *(2005)*

27. If the angle between the vectors $\vec{A}$ and $\vec{B}$ is θ, the value of the product $(\vec{B}\times\vec{A})\cdot\vec{A}$ is equal to
(a) $BA^2\sin\theta$ (b) $BA^2\cos\theta$
(c) $BA^2\sin\theta\cos\theta$ (d) zero.
(2005, 19..)

28. If a vector $2\hat{i}+3\hat{j}+8\hat{k}$ is perpendicular to the vector $4\hat{j}-4\hat{i}+\alpha\hat{k}$, then the value of α is
(a) 1/2 (b) −1/2
(c) 1 (d) −1. *(200..)*

29. If $|\vec{A}\times\vec{B}| = \sqrt{3}\vec{A}\cdot\vec{B}$ then the value of $|\vec{A}+\vec{B}|$ is
(a) $(A^2+B^2+AB)^{1/2}$
(b) $\left(A^2+B^2+\frac{AB}{\sqrt{3}}\right)^{1/2}$
(c) $A+B$
(d) $\left(A^2+B^2+\sqrt{3}AB\right)^{1/2}$. *(200..)*

30. The vector sum of two forces is perpendicular to their vector differences. In that case, the forces
(a) are equal to each other
(b) are equal to each other in magnitude
(c) are not equal to each other in magnitude
(d) cannot be predicted. *(200..)*

31. A particle moves along a circle of radius $\left(\frac{20}{\pi}\right)$ m with constant tangential acceleration. If the velocity of the particle is 80 m/s at the end of the second revolution after motion has begun, the tangential acceleration is
(a) 40 m/s^2 (b) 640π m/s^2
(c) 160π m/s^2 (d) 40π m/s^2. *(200..)*

32. A particle A is dropped from a height and another particle B is projected in horizontal direction with speed of 5 m/sec from the same height then correct statement is
(a) particle A will reach at ground first with respect to particle B
(b) particle B will reach at ground first with respect to particle A
(c) both particles will reach at ground simultaneously
(d) both particles will reach at ground with same speed.
(200..)

33. An object of mass 3 kg is at rest. Now a force of $\vec{F} = 6t^2\hat{i} + 4t\hat{j}$ is applied on the object then velocity of object at $t = 3$ sec. is
(a) $18\hat{i}+3\hat{j}$ (b) $18\hat{i}+6\hat{j}$
(c) $3\hat{i}+18\hat{j}$ (d) $18\hat{i}+4\hat{j}$. *(2002)*

34. If $|\vec{A}+\vec{B}| = |\vec{A}|+|\vec{B}|$ then angle between A and B will be
(a) 90° (b) 120°
(c) 0° (d) 60°. *(2001)*

35. Two particles having mass M and m are moving in a circular path having radius R and r. If their time period are same then the ratio of angular velocity will be
(a) $\frac{r}{R}$ (b) $\frac{R}{r}$
(c) 1 (d) $\sqrt{\frac{R}{r}}$. *(2001)*

36. The width of river is 1 km. The velocity of boat is 5 km/hr. The boat covered the width of river in shortest time 15 min. Then the velocity of river stream is
(a) 3 km/hr (b) 4 km/hr
(c) $\sqrt{29}$ km/hr (d) $\sqrt{41}$ km/hr.
(2000, 1998)

37. Two projectiles of same mass and with same velocity are thrown at an angle 60° and 30° with the horizontal, then which will remain same
(a) time of flight
(b) range of projectile
(c) maximum height acquired
(d) all of them. *(2000)*

38. A man is slipping on a frictionless inclined plane and a bag falls down from the same height. Then the velocity of both is related as
(a) $v_B > v_m$ (b) $v_B < v_m$
(c) $v_B = v_m$
(d) v_B and v_m can't be related. *(2000)*

39. A 500 kg car takes a round turn of radius 50 m with a velocity of 36 km/hr. The centripetal force is
(a) 1000 N (b) 750 N
(c) 250 N (d) 1200 N *(1999)*

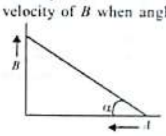
40. A person aiming to reach exactly opposite point on the bank of a stream is swimming with a speed of 0.5 m/s at an angle of 120° with the direction of flow of water. The speed of water in the stream, is
(a) 0.25 m/s (b) 0.5 m/s
(c) 1.0 m/s (d) 0.433 m/s *(1999)*

41. Two racing cars of masses m_1 and m_2 are moving in circles of radii r_1 and r_2 respectively. Their speeds are such that each makes a complete circle in the same time t. The ratio of the angular speeds of the first to the second car is
(a) $r_1 : r_2$ (b) $m_1 : m_2$
(c) 1 : 1 (d) $m_1 m_2 : r_1 r_2$
(1999)

42. If a unit vector is represented by $0.5\hat{i}-0.8\hat{j}+c\hat{k}$ then the value of c is
(a) $\sqrt{0.01}$ (b) $\sqrt{0.11}$
(c) 1 (d) $\sqrt{0.39}$. *(1999)*

43. What is the value of linear velocity, if $\vec{r} = 3\hat{i}-4\hat{j}+\hat{k}$ and $\vec{\omega} = 5\hat{i}-6\hat{j}+6\hat{k}$?
(a) $4\hat{i}-13\hat{j}+6k$ (b) $18\hat{i}+13\hat{j}-2\hat{k}$
(c) $6\hat{i}+2\hat{j}-3\hat{k}$ (d) $6\hat{i}-2\hat{j}+8\hat{k}$.
(1999)

44. Two particles A and B are connected by a rigid rod AB. The rod slides along perpendicular rails as shown here. The velocity of A to the left is 10 m/s. What is the velocity of B when angle a = 60°?
(a) 10 m/s
(b) 9.8 m/s
(c) 5.8 m/s
(d) 17.3 m/s.



(1998)

45. A ball of mass 0.25 kg attached to the end of a string of length 1.96 m is moving in a horizontal circle. The string will break if the tension is more than 25 N. What is the maximum speed with which the ball can be moved?
(a) 5 m/s (b) 3 m/s
(c) 14 m/s (d) 3.92 m/s. *(1998)*

46. Identify the vector quantity among the following
(a) distance (b) angular momentum
(c) heat (d) energy. *(1997)*

47. A body is whirled in a horizontal circle of radius 20 cm. It has an angular velocity of 10 rad/s.

What is its linear velocity at any point on circular path?

(a) 20 m/s (b) $\sqrt{2}$ m/s
(c) 10 m/s (d) 2 m/s. *(1996)*

48. The position vector of a particle is $\vec{r} = (a\cos\omega t)\hat{i} + (a\sin\omega t)\hat{j}$. The velocity of the particle is

(a) directed towards the origin
(b) directed away from the origin
(c) parallel to the position vector
(d) perpendicular to the position vector. *(1995)*

49. The angular speed of a flywheel making 120 revolutions/minute is

(a) 4π rad/s (b) $4\pi^2$ rad/s
(c) π rad/s (d) 2π rad/s. *(1995)*

50. The angle between the two vectors $\vec{A} = 3\hat{i} + 4\hat{j} + 5\hat{k}$ and $\vec{B} = 3\hat{i} + 4\hat{j} - 5\hat{k}$ will be

(a) 90° (b) 180°
(c) zero (d) 45°. *(1994)*

51. A boat is sent across a river with a velocity of 8 kmh^{-1}. If the resultant velocity of boat is 10 kmh^{-1}, then velocity of river is

(a) 12.8 kmh^{-1} (b) 6 kmh^{-1}
(c) 8 kmh^{-1} (d) 10 kmh^{-1} *(1994, 93)*

52. If a body A of mass M is thrown with velocity v at an angle of 30° to the horizontal and another body B of the same mass is thrown with the same speed at an angle of 60° to the horizontal, the ratio of horizontal range of A to B will be

(a) 1 : 3 (b) 1 : 1
(c) $1 : \sqrt{3}$ (d) $\sqrt{3} : 1$. *(1992, 90)*

53. The resultant of $\vec{A} \times 0$ will be equal to

(a) zero (b) A
(c) zero vector (d) unit vector. *(1992)*

54. When milk is churned, cream gets seperated d
to

(a) centripetal force (b) centrifugal force
(c) frictional force (d) gravitational force *(199*

55. An electric fan has blades of length 30 c
measured from the axis of rotation. If the fan i
rotating at 120 rpm, the acceleration of a poi
on the tip of the blade is

(a) 1600 ms^{-2} (b) 47.4 ms^{-2}
(c) 23.7 ms^{-2} (d) 50.55 ms^{-2} *(199*

56. The maximum range of a gun of horizontal terr
is 16 km. If g = 10 ms^{-2}, then muzzle velocity o
a shell must be

(a) 160 ms^{-1} (b) $200\sqrt{2}$ ms^{-1}
(c) 400 ms^{-1} (d) 800 ms^{-1} *(199*

57. A bus is moving on a straight road towards nor
with a uniform speed of 50 km/hour then it turn
left through 90°. If the speed remains unchange
after turning, the increase in the velocity of bu
in the turning process is

(a) 70.7 km/hr along south-west direction
(b) zero (c) 50 km/hr along wes
(d) 70.7 km/hr along north-west direction *(198*

58. The magnitude of vectors $\vec{A}, \vec{B}$ and $\vec{C}$ are 3, 4
and 5 units respectively. If $\vec{A} + \vec{B} = \vec{C}$, the angl
between $\vec{A}$ and $\vec{B}$ is

(a) $\pi/2$ (b) $\cos^{-1}(0.6)$
(c) $\tan^{-1}(7/5)$ (d) $\pi/4$. *(198*

59. A train of 150 metre length is going toward
north direction at a speed of 10 m/s. A parrot
flies at the speed of 5 m/s towards south directio
parallel to the railways track. The time taken b
the parrot to cross the train is

(a) 12 sec (b) 8 sec
(c) 15 sec (d) 10 sec. *(198*

EXPLANATIONS

1. **(a)** : Two vectors $\vec{A}$ and $\vec{B}$ are orthogonal to each other, if their scalar product is zero *i.e.* $\vec{A} \cdot \vec{B} = 0$.

Here, $\vec{A} = \cos\omega t\,\hat{i} + \sin\omega t\,\hat{j}$

and $\vec{B} = \cos\frac{\omega t}{2}\hat{i} + \sin\frac{\omega t}{2}\hat{j}$

$\therefore \quad \vec{A} \cdot \vec{B} = (\cos\omega t\hat{i} + \sin\omega t\hat{j}) \cdot \left(\cos\frac{\omega t}{2}\hat{i} + \sin\frac{\omega t}{2}\hat{j}\right)$

$= \cos\omega t\cos\frac{\omega t}{2} + \sin\omega t\sin\frac{\omega t}{2}$

$(\because \hat{i} \cdot \hat{i} = \hat{j} \cdot \hat{j} = 1 \text{ and } \hat{i} \cdot \hat{j} = \hat{j} \cdot \hat{i} = 0)$

$= \cos\left(\omega t - \frac{\omega t}{2}\right)$

$(\because \cos(A - B) = \cos A\cos B + \sin A\sin B)$

But $\vec{A} \cdot \vec{B} = 0$ (as $\vec{A}$ and $\vec{B}$ are orthogonal to each other)

$\therefore \quad \cos\left(\omega t - \frac{\omega t}{2}\right) = 0$

$\cos\left(\omega t - \frac{\omega t}{2}\right) = \cos\frac{\pi}{2}$ or $\omega t - \frac{\omega t}{2} = \frac{\pi}{2}$

$\frac{\omega t}{2} = \frac{\pi}{2}$ or $t = \frac{\pi}{\omega}$

2 **(a)** : Here, $\vec{R} = 4\sin(2\pi t)\hat{i} + 4\cos(2\pi t)\hat{j}$

The velocity of the particle is

$\vec{v} = \frac{d\vec{R}}{dt} = \frac{d}{dt}[4\sin(2\pi t)\hat{i} + 4\cos(2\pi t)\hat{j}]$

$= 8\pi\cos(2\pi t)\hat{i} - 8\pi\sin(2\pi t)\hat{j}$

Its magnitude is

$|\vec{v}| = \sqrt{(8\pi\cos(2\pi t))^2 + (-8\pi\sin(2\pi t))^2}$

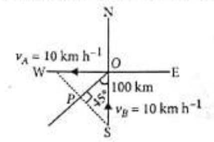
$= \sqrt{64\pi^2\cos^2(2\pi t) + 64\pi^2\sin^2(2\pi t)}$

$= \sqrt{64\pi^2[\cos^2(2\pi t) + \sin^2(2\pi t)]}$

$= \sqrt{64\pi^2}$ (as $\sin^2\theta + \cos^2\theta = 1$)

$= 8\pi$ m/s

3. **(d)** : Given situation is shown in the figure.



Velocity of ship A

v_A = 10 km h^{-1} towards west

Velocity of ship B

v_B = 10 km h^{-1} towards north

OS = 100 km

OP = shortest distance

Relative velocity between A and B is

$v_{AB} = \sqrt{v_A^2 + v_B^2} = 10\sqrt{2}$ km h^{-1}

$\cos 45° = \frac{OP}{OS}; \frac{1}{\sqrt{2}} = \frac{OP}{100}$

$OP = \frac{100}{\sqrt{2}} = \frac{100\sqrt{2}}{2} = 50\sqrt{2}$ km

The time after which distance between them equals to OP is given by

$t = \frac{OP}{v_{AB}} = \frac{50\sqrt{2}}{10\sqrt{2}} \Rightarrow t = 5$ h

4. **(a)** : The equation of trajectory is

$$y = x\tan\theta - \frac{gx^2}{2u^2\cos^2\theta}$$

where θ is the angle of projection and u is the velocity with which projectile is projected.

For equal trajectories and for same angles of projection,

$\frac{g}{u^2}$ = constant

As per question, $\frac{9.8}{5^2} = \frac{g'}{3^2}$

where g' is acceleration due to gravity on the planet.

$g' = \frac{9.8 \times 9}{25} = 3.5$ m s^{-2}

5. **(d)** : At time t = 0, the position vector of the particle is

$\vec{r}_1 = 2\hat{i} + 3\hat{j}$

At time t = 5 s, the position vector of the particle is

$\vec{r}_2 = 13\hat{i} + 14\hat{j}$

Displacement from $\vec{r}_1$ to $\vec{r}_2$ is

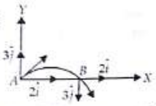
$$\Delta\vec{r} = \vec{r}_2 - \vec{r}_1 = (13\hat{i} + 14\hat{j}) - (2\hat{i} + 3\hat{j})$$

$$= 11\hat{i} + 11\hat{j}$$

$\therefore$ Average velocity,

$$\vec{v}_{av} = \frac{\Delta\vec{r}}{\Delta t} = \frac{11\hat{i} + 11\hat{j}}{5-0} = \frac{11}{5}(\hat{i} + \hat{j})$$

6. (a) :



At point B X component of velocity remains unchanged while Y component reverses its direction.

$\therefore$ The velocity of the projectile at point B is $2\hat{i} - 3\hat{j}$ m/s.

7. (c) : Vector triple product of three vectors $\vec{A}$, $\vec{B}$ and $\vec{C}$ is

$$\vec{A} \times (\vec{B} \times \vec{C}) = (\vec{A} \cdot \vec{C})\vec{B} - (\vec{A} \cdot \vec{B})\vec{C}$$

Given : $\vec{A} \cdot \vec{B} = 0$, $\vec{A} \cdot \vec{C} = 0$

$\therefore \quad \vec{A} \times (\vec{B} \times \vec{C}) = 0$

Thus the vector $\vec{A}$ is parallel to vector $\vec{B} \times \vec{C}$.

8. (b) : Horizontal range, $R = \dfrac{u^2 \sin 2\theta}{g}$

where u is the velocity of projection and θ is the angle of projection

Maximum height, $H = \dfrac{u^2 \sin^2\theta}{2g}$

According to question $R = H$

$$\therefore \quad \frac{u^2 \sin 2\theta}{g} = \frac{u^2 \sin^2\theta}{2g}$$

$$\frac{2u^2 \sin\theta\cos\theta}{g} = \frac{u^2 \sin^2\theta}{2g}$$

$\tan\theta = 4$ or $\theta = \tan^{-1}(4)$

9. (b) : Here, $\vec{u} = 2\hat{i} + 3\hat{j}$, $\vec{a} = 0.3\hat{i} + 0.2\hat{j}$, $t = 10$ s

As $\vec{v} = \vec{u} + \vec{a}t$

$$\therefore \quad \vec{v} = (2\hat{i} + 3\hat{j}) + (0.3\hat{i} + 0.2\hat{j})(10)$$

$$= 2\hat{i} + 3\hat{j} + 3\hat{i} + 2\hat{j} = 5\hat{i} + 5\hat{j}$$

$$|\vec{v}| = \sqrt{(5)^2 + (5)^2} = 5\sqrt{2} \text{ units}$$

10. (d) : Here, Radius, $R = 5$ cm $= 5 \times 10^{-2}$ m

Time period, $T = 0.2\pi$ s

Centripetal acceleration

$$a_c = \omega^2 R = \left(\frac{2\pi}{T}\right)^2 R = \left(\frac{2\pi}{0.2\pi}\right)^2 (5 \times 10^{-2}) = 5 \text{ m/s}^2$$

As particle moves with constant speed, therefore its tangential acceleration is zero. So, $a_t = 0$

The acceleration of the particle is

$$a = \sqrt{a_c^2 + a_t^2} = a_c = 5 \text{ m/s}^2$$

It acts towards the centre of the circle.

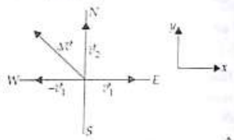
11. (a) : Here, $u = 20$ m/s, $g = 10$ m/s^2

For maximum range, angle of projection is $\theta = 45°$

$$\therefore \quad R_{max} = \frac{u^2 \sin 90°}{g} = \frac{u^2}{g} \qquad \left(\because R = \frac{u^2 \sin 2\theta}{g}\right)$$

$$= \frac{(20 \text{ m/s})^2}{(10 \text{ m/s}^2)} = 40 \text{ m}$$

12. (d) :



Velocity towards east direction, $\vec{v}_1 = 30\hat{i}$ m/s

Velocity towards north direction, $\vec{v}_2 = 40\hat{j}$ m/s

Change in velocity, $\Delta\vec{v} = \vec{v}_2 - \vec{v}_1 = (40\hat{j} - 30\hat{i})$

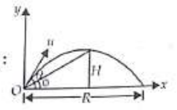
$\therefore \quad |\Delta\vec{v}| = |40\hat{j} - 30\hat{i}| = 50$ m/s

Average acceleration, $\vec{a}_{av} = \dfrac{\text{Change in velocity}}{\text{Time interval}}$

$$\vec{a}_{av} = \frac{\vec{v}_2 - \vec{v}_1}{\Delta t} = \frac{\Delta\vec{v}}{\Delta t}$$

$$|\vec{a}_{av}| = \frac{|\Delta\vec{v}|}{\Delta t} = \frac{50 \text{ m/s}}{10 \text{ s}} = 5 \text{ m/s}^2$$

13. (c) :



Let ϕ be elevation angle of the projectile at its highest point as seen from the point of projection O and θ be angle of projection with the horizontal.

From figure, $\tan\phi = \dfrac{H}{R/2}$ ...(i)

In case of projectile motion

Maximum height, $H = \dfrac{u^2 \sin^2\theta}{2g}$

Horizontal range, $R = \dfrac{u^2 \sin 2\theta}{g}$

Substituting these values of H and R in (i), we get

$$\tan\phi = \frac{\frac{u^2 \sin^2\theta}{2g}}{\frac{u^2 \sin 2\theta}{2g}}$$

$$\tan\phi = \frac{\sin^2\theta}{\sin 2\theta} = \frac{\sin^2\theta}{2\sin\theta\cos\theta} = \frac{1}{2}\tan\theta$$

$$\tan\phi = \frac{1}{2}\tan 45° = \frac{1}{2}$$

Here, $\theta = 45°$

$$\therefore \quad \tan\phi = \frac{1}{2}\tan 45° = \frac{1}{2} \qquad (\because \tan 45° = 1)$$

$$\phi = \tan^{-1}\left(\frac{1}{2}\right)$$

14. (b) : Here,

Initial velocity, $\vec{u} = 3\hat{i} + 4\hat{j}$

Acceleration, $\vec{a} = 0.4\hat{i} + 0.3\hat{j}$

Time, $t = 10$ s

Let $\vec{v}$ be velocity of a particle after 10 s.

Using, $\vec{v} = \vec{u} + \vec{a}t$

$$\therefore \quad \vec{v} = (3\hat{i} + 4\hat{j}) + (0.4\hat{i} + 0.3\hat{j})(10)$$

$$= 3\hat{i} + 4\hat{j} + 4\hat{i} + 3\hat{j} = 7\hat{i} + 7\hat{j}$$

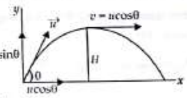
Speed of the particle after 10 s $= |\vec{v}|$

$$= \sqrt{(7)^2 + (7)^2} = 7\sqrt{2} \text{ units}$$

15. (c) :

From figure, $\vec{d} + \vec{e} = \vec{f}$

16. (a) : Let v be velocity of a projectile at maximum height H.



$v = u\cos\theta$

According to given problem, $v = \dfrac{u}{2}$

$\therefore \quad \dfrac{u}{2} = u\cos\theta \Rightarrow \cos\theta = \dfrac{1}{2}$

$\Rightarrow \theta = 60°$

17. (b) : $x = a\sin\omega t$ or $\dfrac{x}{a} = \sin\omega t$ ...(i)

$y = a\cos\omega t$ or $\dfrac{y}{a} = \cos\omega t$ ...(ii)

Squaring and adding, we get

$$\frac{x^2}{a^2} + \frac{y^2}{a^2} = 1 \qquad (\because \cos^2\omega t + \sin^2\omega t = 1)$$

or $x^2 + y^2 = a^2$

This is the equation of a circle. Hence particle follows a circular path.

18. (d) : Because the slope is highest at C, $v = \dfrac{ds}{dt}$ is maximum.

19. (a) :

The horizontal momentum does not change. The change in vertical momentum is

$$mv\sin\theta - (-mv\sin\theta) = 2mv\frac{1}{\sqrt{2}} = \sqrt{2}mv$$

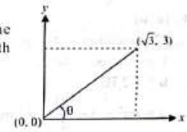
20. (d) : $|\vec{A} \times \vec{B}| = \sqrt{3}(\vec{A} \cdot \vec{B})$

$\therefore \quad AB\sin\theta = \sqrt{3}AB\cos\theta$

or, $\tan\theta = \sqrt{3}$ or, $\theta = \tan^{-1}\sqrt{3} = 60°$.

21. (b) : Let θ be the angle which the particle makes with an x-axis.

From figure,



$\tan\theta = \dfrac{3}{\sqrt{3}} = \sqrt{3}$

or, $\theta = \tan^{-1}(\sqrt{3}) = 60°$.

22. (b) : The centre of the tube will be at length $L/2$. So radius $r = L/2$.

The force exerted by the liquid at the other end = centrifugal force

Centrifugal force $= Mr\omega^2 = M\left(\frac{L}{2}\right)\omega^2 = \frac{ML\omega^2}{2}$.

23. **(b)** : Horizontal range $R = \frac{u^2 \sin 2\theta}{g}$

For angle of projection $(45° - \theta)$, the horizontal range is

$\therefore \quad R_1 = \frac{u^2 \sin[2(45° - \theta)]}{g} = \frac{u^2 \sin(90° - 2\theta)}{g}$

$= \frac{u^2 \cos 2\theta}{g}$

For angle of projection $(45° + \theta)$, the horizontal range is

$R_2 = \frac{u^2 \sin[2(45° + \theta)]}{g} = \frac{u^2 \sin(90° + 2\theta)}{g}$

$= \frac{u^2 \cos 2\theta}{g}$

$\therefore \quad \frac{R_1}{R_2} = \frac{u^2 \cos 2\theta / g}{u^2 \cos 2\theta / g} = \frac{1}{1}$.

$\therefore$ The range is the same.

24. **(b)** : Let θ be angle between $\vec{A}$ and $\vec{B}$

$|\vec{A} + \vec{B}| = |\vec{A} - \vec{B}|$, then $|\vec{A} + \vec{B}|^2 = |\vec{A} - \vec{B}|^2$

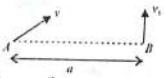
or $(\vec{A} + \vec{B}) \cdot (\vec{A} + \vec{B}) = (\vec{A} - \vec{B}) \cdot (\vec{A} - \vec{B})$

or $\vec{A} \cdot \vec{A} + \vec{A} \cdot \vec{B} + \vec{B} \cdot \vec{A} + \vec{B} \cdot \vec{B}$

$= \vec{A} \cdot \vec{A} - \vec{A} \cdot \vec{B} - \vec{B} \cdot \vec{A} + \vec{B} \cdot \vec{B}$

or $4AB\cos\theta = 0$ or $\cos\theta = 0°$ or $\theta = 90°$

25. **(d)** :



$t = \frac{a}{v'} = \frac{a}{\sqrt{v^2 - v_1^2}}$

26. **(a, b)** : $a = r\omega^2$; $\omega = 2\pi\upsilon$

22 revolution = 44 sec.

1 revolution = 44/22 = 2 sec.

$\upsilon = 1/2$ Hz

$a = r\omega^2 = 1 \times \frac{4\pi^2}{4} = \pi^2$ m/s^2.

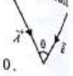
Towards the centre, the centripetal acceleration $= -\omega^2 R$

and away from the centre, the centrifugal acceleration is $+\omega^2 R$.

$\therefore$ (a) and (b) are correct as the directions are given.

27. **(d)** : Let $\vec{A} \times \vec{B} = \vec{C}$

The cross product of $\vec{B}$ and $\vec{A}$ is perpendicular to the plane containing $\vec{A}$ and $\vec{B}$ i.e. perpendicular to $\vec{A}$. If a dot product of this cross product and $\vec{A}$ is taken, as the cross product is perpendicular to $\vec{A}$, $\vec{C} \times \vec{A} = 0$.



Therefore product of $(\vec{B} \times \vec{A}) \cdot \vec{A} = 0$.

28. **(b)** : $\vec{a} = 2\hat{i} + 3\hat{j} + 8\hat{k}$, $\vec{b} = 4\hat{j} - 4\hat{i} + \alpha\hat{k}$

$\vec{a} \cdot \vec{b} = 0$ if $\vec{a} \perp \vec{b}$

$(2\hat{i} + 3\hat{j} + 8\hat{k}) \cdot (-4\hat{i} + 4\hat{j} + \alpha\hat{k}) = 0$

or, $-8 + 12 + 8\alpha = 0 \Rightarrow 4 + 8\alpha = 0$

$\Rightarrow \alpha = -1/2$.

29. **(a)** : $|\vec{A} \times \vec{B}| = \sqrt{3}\vec{A} \cdot \vec{B}$

$|\vec{A}||\vec{B}|\sin\theta = \sqrt{3}|\vec{A}||\vec{B}|\cos\theta$

$\tan\theta = \sqrt{3} \Rightarrow \theta = 60°$

$|\vec{A} + \vec{B}| = \sqrt{|\vec{A}|^2 + |\vec{B}|^2 + 2|\vec{A}||\vec{B}|\cos\theta}$

$= (A^2 + B^2 + AB)^{1/2}$

30. **(b)** : Given : $(\vec{F_1} + \vec{F_2}) \perp (\vec{F_1} - \vec{F_2})$

$\therefore (\vec{F_1} + \vec{F_2}) \cdot (\vec{F_1} - \vec{F_2}) = 0$

$F_1^2 - F_2^2 - \vec{F_1} \cdot \vec{F_2} + \vec{F_2} \cdot \vec{F_1} = 0 \Rightarrow F_1^2 = F_2^2$

i.e. F_1, F_2 are equal to each other in magnitude.

31. **(a)** : Given :

$r = \frac{20}{\pi}$ m, $v = 80$ m/s, $\theta = 2$ rev $= 4\pi$ rad.

From equation $\omega^2 = \omega_0^2 + 2\alpha\theta \quad (\omega_0 = 0)$

$\omega^2 = 2\alpha\theta \left(\omega = \frac{v}{r} \text{ and } a = r\alpha\right)$

$a = \frac{v^2}{2r\theta} = 40$ m/s^2.

32. **(c)** : Time required to reach the ground is dependent on the vertical motion of the particle. Vertical motion of both the particles A and B are exactly same. Although particle B has an initial velocity, but that is in horizontal direction and it has no component in vertical (component of a vector at a direction of $90° = 0$) direction. Hence they will reach the ground simultaneously.

33. **(b)** : Mass, $m = 3$ kg, force, $F = 6t^2\hat{i} + 4t\hat{j}$

$\therefore$ acceleration, $a = F/m$

$= \frac{6t^2\hat{i} + 4t\hat{j}}{3} = 2t^2\hat{i} + \frac{4}{3}t\hat{j}$

Now, $a = \frac{dv}{dt} = 2t^2\hat{i} + \frac{4}{3}t\hat{j}$;

$\therefore dv = \left(2t^2\hat{i} + \frac{4}{3}t\hat{j}\right)dt \quad \therefore v = \int_0^3 \left(2t^2\hat{i} + \frac{4}{3}t\hat{j}\right)dt$

$= \frac{2}{3}t^3\hat{i} + \frac{4}{6}t^2\hat{j}\Big|_0^3 = 18\hat{i} + 6\hat{j}$.

34. **(c)** : $|\vec{A} + \vec{B}| = |\vec{A}| + |\vec{B}|$ if $\vec{A} \parallel \vec{B}$. $\theta = 0°$.

35. **(c)** : $\omega = \frac{2\pi}{t}$, t is same $\therefore \frac{\omega_1}{\omega_2} = 1$

36. **(a)** : $v_{Resultant} = \frac{1 \text{ km}}{1/4 \text{ hr}} = 4$ km/hr

$\therefore v_{River} = \sqrt{5^2 - 4^2} = 3$ km/hr

37. **(b)** : As $\theta_2 = (90 - \theta_1)$

So range of projectile $R_1 = \frac{v_0^2 \sin 2\theta}{g}$

$= \frac{v_0^2 \, 2\sin\theta\cos\theta}{g}$

$R_2 = \frac{v_0^2 \, 2\sin(90 - \theta_1)\cos(90 - \theta_1)}{g}$

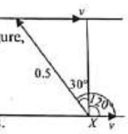
$R_2 = \frac{v_0^2 \, 2\cos\theta_1 \sin\theta_1}{g} = R_1$

38. **(c)** : Vertical acceleration in both the cases is g, whereas horizontal velocity is constant.

39. **(a)** : $F_{centripetal} = \frac{mv^2}{R}$; $\quad v = \left(36 \times \frac{5}{18}\right)$ m/s

$F_{centripetal} = \frac{500 \times \left(36 \times \frac{5}{18}\right)^2}{50} = 1000$ N

40. **(a)** : Let v be the velocity of river water. As shown in figure,



$\sin 30° = \frac{v}{0.5}$

or, $v = 0.5 \sin 30°$

$= 0.5 \times (1/2) = 0.25$ m/s.

41. **(c)** : $t = \frac{2\pi}{\omega_1} = \frac{2\pi}{\omega_2} \Rightarrow \frac{\omega_1}{\omega_2} = \frac{1}{1}$

42. **(b)** : For a unit vector $\hat{n}, |\hat{n}| = 1$

$|0.5\hat{i} - 0.8\hat{j} + c\hat{k}|^2 = 1^2 \Rightarrow 0.25 + 0.64 + c^2 = 1$

or $c = \sqrt{0.11}$

43. **(b)** : $\vec{v} = \vec{\omega} \times \vec{r} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 5 & -6 & 6 \\ 3 & -4 & 1 \end{vmatrix} = 18\hat{i} + 13\hat{j} - 2\hat{k}$

44. **(d)** : Let particle B move upwards with velocity v,

then $\tan 60° = \frac{v}{10}$; $\quad v = \sqrt{3} \times 10 = 17.3$ m/s.

45. **(c)** : $\frac{mv^2}{r} = 25$; $\quad v = \sqrt{\frac{25 \times 1.96}{0.25}} = 14$ m/s.

46. **(b)** : Since the angular momentum has both magnitude and direction, it is a vector quantity.

47. **(d)** : Radius of circle $(r) = 20$ cm $= 0.2$ m and angular velocity $(\omega) = 10$ rad/s.

linear velocity $(v) = r\omega$

$= 0.2 \times 10 = 2$ m/s.

48. **(d)** : Position vector of the particle

$(r) = (a\cos\omega t)\hat{i} + (a\sin\omega t)\hat{j}$

velocity vector

$\vec{v} = \frac{d\vec{r}}{dt} = (-a\omega\sin\omega t)\hat{i} + (a\omega\cos\omega t)\hat{j}$

$= \omega\left[(-a\sin\omega t)\hat{i} + (a\cos\omega t)\hat{j}\right]$

$\vec{v} \cdot \vec{r} = \omega[(-a\sin\omega t)\hat{i} + (a\cos\omega t)\hat{j})] \cdot [(a\cos\omega t)\hat{i} + (a\sin\omega t)\hat{j})]$

$= \omega[-a^2\sin\omega t\cos\omega t + a^2\cos\omega t\sin\omega t] = 0$

Therefore velocity vector is perpendicular to the displacement vector.

49. **(a)** : Number of revolutions per minute $(n) = 120$.

Therefore angular speed (ω)

$= \frac{2\pi n}{60} = \frac{2\pi \times 120}{60} = 4\pi$ rad/s.

50. **(a)** : $\vec{A} = 3\hat{i} + 4\hat{j} + 5\hat{k}$ and $\vec{B} = 3\hat{i} + 4\hat{j} - 5\hat{k}$.

$\cos\theta = \frac{\vec{A} \cdot \vec{B}}{|\vec{A}||\vec{B}|}$

$= \frac{(3\hat{i} + 4\hat{j} + 5\hat{k}) \cdot (3\hat{i} + 4\hat{j} - 5\hat{k})}{[\sqrt{(3)^2 + (4)^2 + (5)^2}] \times [\sqrt{(3)^2 + (4)^2 + (5)^2}]}$

$= \frac{9 + 16 - 25}{50} = 0$ or $\theta = 90°$.

51. **(b)** : Let the velocity of river be v_R and velocity of boat is v_B

$\therefore$ Resultant velocity $= \sqrt{v_B^2 + v_R^2 + 2v_B v_R \cos\theta}$

$(10) = \sqrt{v_B^2 + v_R^2 + 2v_B v_R \cos 90°}$

$(10) = \sqrt{(8)^2 + v_R^2}$ or $(10)^2 = (8)^2 + v_R^2$

$v_R^2 = 100 - 64 \quad$ or $v_R = 6$ km/hr

52. (b) : For the given velocity of projection u, the horizontal range is the same for the angle of projection θ and $90° - \theta$

Horizontal range $R = \frac{u^2 \sin 2\theta}{g}$

$\therefore$ For body A $R_A = \frac{u^2 \sin(2\times 30°)}{g} = \frac{u^2 \sin 60°}{g}$

For body B $R_B = \frac{u^2 \sin(2\times 60°)}{g}$

$R_B = \frac{u^2 \sin 120°}{g} = \frac{u^2 \sin(180° - 60°)}{g} = \frac{u^2 \sin 60°}{g}$

The range is the same whether the angle is θ or $90° - \theta$.

$\therefore$ The ratio of ranges is 1 : 1

53. (c) : The cross product $\vec{A}\times\vec{B}$ is a vector, with its direction perpendicular to both $\vec{A}$ and $\vec{B}$. $\vec{A}\times\vec{B}$ is area. If side B is zero, area is zero.

$\vec{A}\times 0$ is a zero vector.

If in case 0 is a scalar, then also the product is zero. But a scalar × a vector is also a vector.

Hence one gets a zero vector in any case.

54. (b) : When milk is churned, cream gets separated due to centrifugal force.

55. (b) : Frequency of rotation υ = 120 rpm = 2 rps

length of blade r = 30 cm = 0.3 m

Centripetal acceleration $a = \omega^2 r = (2\pi\upsilon)^2 r$

$= 4\pi^2\upsilon^2 r = 4\pi^2(2)^2(0.3) = 47.4 \text{ ms}^{-2}$

56. (c) : Horizontal range $R = \frac{u^2 \sin 2\theta}{g}$

For maximum horizontal range $\theta = 45°$

or $R_m = \frac{u^2}{g}$

where u be muzzle velocity of a shell

$\therefore$ $(1600 \text{ m}) = \frac{u^2}{(10 \text{ ms}^{-2})^2}$

or $u = 400 \text{ ms}^{-1}$.

57. (a) : v_1 = 50 km/hr due north

v_2 = 50 km/hr due west

$-v_1$ = 50 km/hr due south

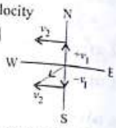
Magnitude of change in velocity

$= |\vec{v}_2 - \vec{v}_1| = |\vec{v}_2 + (-\vec{v}_1)|$

$= \sqrt{v_2^2 + (-v_1)^2}$

$= \sqrt{(50)^2 + (50)^2}$

$=$ 70.7 km/hr along south-west direction



58. (a) : Let θ be angle between $\vec{A}$ and $\vec{B}$

Given : $A = |\vec{A}|$ = 3 units

$B = |\vec{B}|$ = 4 units

$C = |\vec{C}|$ = 5 units

$\vec{A} + \vec{B} = \vec{C}$

$\therefore$ $(\vec{A}+\vec{B})\cdot(\vec{A}+\vec{B}) = \vec{C}\cdot\vec{C}$

$\vec{A}\cdot\vec{A} + \vec{A}\cdot\vec{B} + \vec{B}\cdot\vec{A} + \vec{B}\cdot\vec{B} = \vec{C}\cdot\vec{C}$

$A^2 + 2AB\cos\theta + B^2 = C^2$

$9 + 2AB\cos\theta + 16 = 25$ or $2AB\cos\theta = 0$

or $\cos\theta = 0 \therefore \theta = 90°$.

59. (d) : Choose the positive direction of x-axis to be from south to north. Then

Velocity of train $v_T = +10 \text{ ms}^{-1}$

Velocity of parrot $v_P = -5 \text{ ms}^{-1}$

Relative velocity of parrot with respect to train

$= v_P - v_T = (-5 \text{ ms}^{-1}) - (+10 \text{ ms}^{-1}) = -15 \text{ ms}^{-1}$

i.e. parrot appears to move with a speed of 15 ms^{-1} from north to south

$\therefore$ Time taken by parrot to cross the train

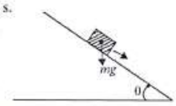
$= \frac{150 \text{ m}}{15 \text{ ms}^{-1}} = 10 \text{ s}$

CHAPTER 4

Laws of Motion

1. Two stones of masses m and $2m$ are whirled in horizontal circles, the heavier one in a radius $\frac{r}{2}$ and the lighter one in radius r. The tangential speed of lighter stone is n times that of the value of heavier stone when they experience same centripetal forces. The value of n is
(a) 4 (b) 1
(c) 2 (d) 3 *(AIPMT 2015)*

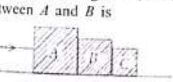
2. A plank with a box on it at one end is gradually raised about the other end. As the angle of inclination with the horizontal reaches 30°, the box starts to slip and slides 4.0 m down the plank in 4.0 s.



The coefficients of static and kinetic friction between the box and the plank will be, respectively
(a) 0.5 and 0.6 (b) 0.4 and 0.3
(c) 0.6 and 0.6 (d) 0.6 and 0.5

(AIPMT 2015)

3. Three blocks A, B and C, of masses 4 kg, 2 kg and 1 kg respectively, are in contact on a frictionless surface, as shown. If a force of 14 N is applied on the 4 kg block, then the contact force between A and B is



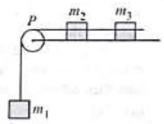
(a) 8 N (b) 18 N
(c) 2 N (d) 6 N

(AIPMT 2015, Cancelled)

4. A block A of mass m_1 rests on a horizontal table. A light string connected to it passes over a frictionless pully at the edge of table and from its other end another block B of mass m_2 is suspended. The coefficient of kinetic friction between the block and the table is μ_k. When the block A is sliding on the table, the tension in the string is
(a) $\frac{m_1 m_2(1+\mu_k)g}{(m_1+m_2)}$ (b) $\frac{m_1 m_2(1-\mu_k)g}{(m_1+m_2)}$
(c) $\frac{(m_2+\mu_k m_1)g}{(m_1+m_2)}$ (d) $\frac{(m_2-\mu_k m_1)g}{(m_1+m_2)}$

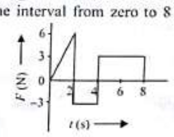
(AIPMT 2015, Cancelled)

5. A system consists of three masses m_1, m_2 and m_3 connected by a string passing over a pulley P. The mass m_1 hangs freely and m_2 and m_3 are on a rough horizontal table (the coefficient of friction = μ). The pulley is frictionless and of negligible mass. The downward acceleration of mass m_1 is (Assume $m_1 = m_2 = m_3 = m$)
(a) $\frac{g(1-g\mu)}{9}$
(b) $\frac{2g\mu}{3}$
(c) $\frac{g(1-2\mu)}{3}$
(d) $\frac{g(1-2\mu)}{2}$



(AIPMT 2014)

6. The force F acting on a particle of mass m is indicated by the force-time graph shown below. The change in momentum of the particle over the time interval from zero to 8 s is



(a) 24 N s (b) 20 N s
(c) 12 N s (d) 6 N s
(AIPMT 2014)

7. A balloon with mass m is descending down with an acceleration a (where $a < g$). How much mass should be removed from it so that it starts moving up with an acceleration a?
(a) $\frac{2ma}{g+a}$ (b) $\frac{2ma}{g-a}$
(c) $\frac{ma}{g+a}$ (d) $\frac{ma}{g-a}$
(AIPMT 2014)

8. Three blocks with masses m, $2m$ and $3m$ are connected by strings, as shown in the figure. After an upward force F is applied on block m, the masses move upward at constant speed v. What is the net force on the block of mass $2m$? (g is the acceleration due to gravity)

(a) $3mg$
(b) $6mg$
(c) zero
(d) $2mg$
(NEET 2013)

9. An explosion breaks a rock into three parts in a horizontal plane. Two of them go off at right angles to each other. The first part of mass 1 kg moves with a speed of 12 ms^{-1} and the second part of mass 2 kg moves with 8 ms^{-1} speed. If the third part flies off with 4 ms^{-1} speed, then its mass is
(a) 7 kg (b) 17 kg
(c) 3 kg (d) 5 kg *(NEET 2013)*

10. The upper half of an inclined plane of inclination θ is perfectly smooth while lower half is rough. A block starting from rest at the top of the plane will again come to rest at the bottom, if the coefficient of friction between the block and lower half of the plane is given by
(a) $\mu = 2\tan\theta$ (b) $\mu = \tan\theta$
(c) $\mu = \frac{1}{\tan\theta}$ (d) $\mu = \frac{2}{\tan\theta}$
(NEET 2013)

11. A car is moving in a circular horizontal track of radius 10 m with a constant speed of 10 m/s. A bob is suspended from the roof of the car by a light wire of length 1.0 m. The angle made by the wire with the vertical is
(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{6}$
(c) $\frac{\pi}{4}$ (d) 0°
(Karnataka NEET 2013)

12. A person holding a rifle (mass of person and rifle together is 100 kg) stands on a smooth surface and fires 10 shots horizontally, in 5 s. Each bullet has a mass of 10 g with a muzzle velocity of 800 ms^{-1}. The final velocity acquired by the person and the average force exerted on the person are
(a) $-0.08\ ms^{-1}$, 16 N (b) $-0.8\ ms^{-1}$, 8 N
(c) $-1.6\ ms^{-1}$, 16 N (d) $-1.6\ ms^{-1}$, 8 N
(Karnataka NEET 2013)

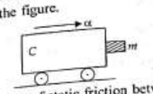
13. A stone is dropped from a height h. It hits the ground with a certain momentum P. If the same stone is dropped from a height 100% more than the previous height, the momentum when it hits the ground will change by
(a) 68% (b) 41%
(c) 200% (d) 100% *(Mains 2012)*

14. A person of mass 60 kg is inside a lift of mass 940 kg and presses the button on control panel. The lift starts moving upwards with an acceleration 1.0 m/s^2. If $g = 10\ m\ s^{-2}$, the tension in the supporting cable is
(a) 8600 N (b) 9680 N
(c) 11000 N (d) 1200 N *(Prelims 2011)*

15. A body of mass M hits normally a rigid wall with velocity V and bounces back with the same velocity. The impulse experienced by the body is
(a) MV (b) $1.5MV$
(c) $2MV$ (d) zero *(Prelims 2011)*

16. A conveyor belt is moving at a constant speed of 2 ms^{-1}. A box is gently dropped on it. The coefficient of friction between them is $\mu = 0.5$. The distance that the box will move relative to belt before coming to rest on it, taking $g = 10\ m\ s^{-2}$, is
(a) 0.4 m (b) 1.2 m
(c) 0.6 m (d) zero *(Mains 2011)*

17. A block of mass m is in contact with the cart C as shown in the figure.



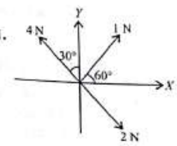
The coefficient of static friction between the block and the cart is μ. The acceleration α of the cart that will prevent the block from falling satisfies
(a) $\alpha > \frac{mg}{\mu}$ (b) $\alpha > \frac{g}{\mu m}$
(c) $\alpha \geq \frac{g}{\mu}$ (d) $\alpha < \frac{g}{\mu}$
(Prelims 2010)

18. The mass of a lift is 2000 kg. When the tension in the supporting cable is 28000 N, then its acceleration is
(a) 4 ms^{-2} upwards (b) 4 ms^{-2} downwards
(c) 14 ms^{-2} upwards (d) 30 ms^{-2} downwards
(Prelims 2009)

19. A body, under the action of a force $\vec{F} = 6\hat{i} - 8\hat{j} + 10\hat{k}$, acquires an acceleration of 1 m/s^2. The mass of this body must be
(a) 10 kg (b) 20 kg
(c) $10\sqrt{2}$ kg (d) $2\sqrt{10}$ kg
(Prelims 2009)

20. A roller coaster is designed such that riders experience "weightlessness" as they go round the top of a hill whose radius of curvature is 20 m. The speed of the car at the top of the hill is between
(a) 16 m/s and 17 m/s
(b) 13 m/s and 14 m/s
(c) 14 m/s and 15 m/s
(d) 15 m/s and 16 m/s *(Prelims 2008)*

21.



Three forces acting on a body are shown in the figure. To have the resultant force only along the y-direction, the magnitude of the minimum additional force needed is
(a) $\frac{\sqrt{3}}{4}$ N (b) $\sqrt{3}$ N
(c) 0.5 N (d) 1.5 N *(Prelims 2008)*

22. Sand is being dropped on a conveyer belt at the rate of M kg/s. The force necessary to keep the belt moving with a constant velocity of v m/s will be
(a) $\frac{Mv}{2}$ newton (b) zero
(c) Mv newton (d) 2 Mv newton
(Prelims 2008)

23. A block B is pushed momentarily along a horizontal surface with an initial velocity V. If μ is the coefficient of sliding friction between B and the surface, block B will come to rest after a time

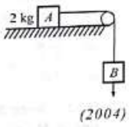
(a) $g\mu/V$
(b) g/V
(c) V/g
(d) $V/(g\mu)$.
(2007)

24. A 0.5 kg ball moving with a speed of 12 m/s strikes a hard wall at an angle of 30° with the wall. It is reflected with the same speed at the same angle. If the ball is in contact with the wall for 0.25 seconds, the average force acting on the wall is
(a) 96 N (b) 48 N
(c) 24 N (d) 12 N. *(2006)*

25. A block of mass m is placed on a smooth wedge of inclination θ. The whole system is accelerated horizontally so that the block does not slip on the wedge. The force exerted by the wedge on the block will be (g is acceleration due to gravity)
(a) $mg\cos\theta$ (b) $mg\sin\theta$
(c) mg (d) $mg/\cos\theta$
(2004)

26. The coefficient of static friction, μ_s, between block A of mass 2 kg and the table as shown in the figure is 0.2. What would be the maximum

mass value of block B so that the two blocks do not move? The string and the pulley are assumed to be smooth and massless. ($g = 10\ m/s^2$)



(a) 2.0 kg
(b) 4.0 kg
(c) 0.2 kg
(d) 0.4 kg *(2004)*

27. A man weighs 80 kg. He stands on a weighing scale in a lift which is moving upwards with a uniform acceleration of $5\ m/s^2$. What would be the reading on the scale ? ($g = 10\ m/s^2$)
(a) zero (b) 400 N
(c) 800 N (d) 1200 N *(2003)*

28. A monkey of mass 20 kg is holding a vertical rope. The rope will not break when a mass of 25 kg is suspended from it but will break if the mass exceeds 25 kg. What is the maximum acceleration with which the monkey can climb up along the rope ?($g = 10\ m/s^2$)
(a) $5\ m/s^2$ (b) $10\ m/s^2$
(c) $25\ m/s^2$ (d) $2.5\ m/s^2$ *(2003)*

29. A lift of mass 1000 kg which is moving with acceleration of $1\ m/s^2$ in upward direction, then the tension developed in string which is connected to lift is
(a) 9800 N (b) 10,800 N
(c) 11,000 N (d) 10,000 N. *(2002)*

30. A block of mass 10 kg placed on rough horizontal surface having coefficient of friction $\mu = 0.5$, if a horizontal force of 100 N acting on it then acceleration of the block will be
(a) $10\ m/s^2$ (b) $5\ m/s^2$
(c) $15\ m/s^2$ (d) $0.5\ m/s^2$.
(2002)

31. 250 N force is required to raise 75 kg mass from a pulley. If rope is pulled 12 m then the load is lifted to 3 m, the efficiency of pulley system will be
(a) 25% (b) 33.3%
(c) 75% (d) 90%. *(2001)*

32. On the horizontal surface of a truck a block of mass 1 kg is placed ($\mu = 0.6$) and truck is moving with acceleration $5\ m/sec^2$ then the frictional force on the block will be
(a) 5 N (b) 6 N
(c) 5.88 N (d) 8 N. *(2001)*

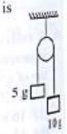
33. A cricketer catches a ball of mass 150 gm in 0.1 sec moving with speed 20 m/s, then he experiences force of
(a) 300 N (b) 30 N
(c) 3 N (d) 0.3 N. *(2001)*

34. A 1 kg stationary bomb is exploded in three parts having mass 1 : 1 : 3 respectively. Parts having same mass move in perpendicular direction with velocity 30 m/s, then the velocity of bigger part will be
(a) $10\sqrt{2}$ m/sec (b) $\frac{10}{\sqrt{2}}$ m/sec
(c) $15\sqrt{2}$ m/sec (d) $\frac{15}{\sqrt{2}}$ m/sec.
(2001)

35. A body of mass 3 kg hits a wall at an angle of 60° and returns at the same angle. The impact time was 0.2 sec. The force exerted on the wall

(a) $150\sqrt{3}$ N
(b) $50\sqrt{3}$ N
(c) 100 N
(d) $75\sqrt{3}$ N. *(2000)*

36. Two masses as shown in the figure are suspended from a massless pulley. The acceleration of the system when masses are left free is



(a) $\frac{2g}{3}$
(b) $\frac{g}{3}$
(c) $\frac{g}{9}$
(d) $\frac{g}{7}$. *(2000)*

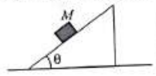
37. If the force on a rocket, moving with a velocity of 300 m/s is 210 N, then the rate of combustion of the fuel is
(a) 0.07 kg/s (b) 1.4 kg/s
(c) 0.7 kg/s (d) 10.7 kg/s *(1999)*

38. A mass of 1 kg is suspended by a thread. It is
(i) lifted up with an acceleration $4.9\ m/s^2$,
(ii) lowered with an acceleration $4.9\ m/s^2$.

The ratio of the tensions is
(a) 1 : 3 (b) 1 : 2
(c) 3 : 1 (d) 2 : 1
(1998)

39. A bullet is fired from a gun. The force on the bullet is given by
$F = 600 - 2 \times 10^5\ t$
where, F is in newton and t in seconds. The force on the bullet becomes zero as soon as it leaves the barrel. What is the average impulse imparted to the bullet?
(a) 9 N-s (b) zero
(c) 1.8 N-s (d) 0.9 N-s *(1998)*

40. A mass M is placed on a very smooth wedge resting on a surface without friction. Once the mass is released, the acceleration to be given to the wedge so that M remains at rest is a where



(a) a is applied to the left and $a = g\tan\theta$
(b) a is applied to the right and $a = g\tan\theta$
(c) a is applied to the left and $a = g\sin\theta$
(d) a is applied to the left and $a = g\cos\theta$
(1998)

41. A 5000 kg rocket is set for vertical firing. The exhaust speed is $800\ ms^{-1}$. To give an initial upward acceleration of $20\ ms^{-2}$, the amount of gas ejected per second to supply the needed thrust will be ($g = 10\ ms^{-2}$)
(a) $185.5\ kgs^{-1}$ (b) $187.5\ kgs^{-1}$
(c) $127.5\ kgs^{-1}$ (d) $137.5\ kgs^{-1}$ *(1998)*

42. A force of 6 N acts on a body at rest and of mass 1 kg. During this time, the body attains a velocity of 30 m/s. The time for which the force acts on the body is
(a) 7 seconds (b) 5 seconds
(c) 10 seconds (d) 8 seconds. *(1997)*

43. A 10 N force is applied on a body produce in it an acceleration of $1\ m/s^2$. The mass of the body is
(a) 15 kg (b) 20 kg
(c) 10 kg (d) 5 kg. *(1996)*

44. A force vector applied on a mass is represented as $\vec{F} = 6\hat{i} - 8\hat{j} + 10\hat{k}$ and accelerates with $1\ m/s^2$. What will be the mass of the body?
(a) 10 kg (b) 20 kg
(c) $10\sqrt{2}$ kg (d) $2\sqrt{10}$ kg.
(1996)

45. A man fires a bullet of mass 200 gm at a speed of 5 m/s. The gun is of one kg mass. By what velocity the gun rebounds backward?
(a) 1 m/s (b) 0.01 m/s
(c) 0.1 m/s (d) 10 m/s. *(1996)*

46. In a rocket, fuel burns at the rate of 1 kg/s. This fuel is ejected from the rocket with a velocity of 60 km/s. This exerts a force on the rocket equal to
(a) 6000 N (b) 60000 N
(c) 60 N (d) 600 N. *(1994)*

47. A block has been placed on a inclined plane with the slope angle θ, block slides down the plane at constant speed. The coefficient of kinetic friction is equal to
(a) $\sin\theta$ (b) $\cos\theta$
(c) g (d) $\tan\theta$ *(1993)*

48. A monkey is decending from the branch of a tree with constant acceleration. If the breaking strength is 75% of the weight of the monkey, the minimum acceleration with which monkey can slide down without branch is
(a) g (b) $\frac{3g}{4}$
(c) $\frac{g}{4}$ (d) $\frac{g}{2}$ *(1993)*

49. Consider a car moving along a straight horizontal road with a speed of 72 km/h. If the coefficient of static friction between the tyres and the road is 0.5, the shortest distance in which the car can be stopped is (taking $g = 10\ m/s^2$)
(a) 30 m (b) 40 m
(c) 72 m (d) 20 m *(1992)*

50. Physical independence of force is a consequence of
(a) third law of motion
(b) second law of motion
(c) first law of motion
(d) all of these laws *(1991)*

51. A heavy uniform chain lies on horizontal table top. If the coefficient of friction between the

chain and the table surface is 0.25, then the maximum fraction of the length of the chain that can hang over one edge of the table is
(a) 20% (b) 25%
(c) 35% (d) 15% *(1991)*

52. A particle of mass m is moving with a uniform velocity v_1. It is given an impulse such that its velocity becomes v_2. The impulse is equal to
(a) $m[|v_2| - |v_1|]$ (b) $\frac{1}{2}m[v_2^2 - v_1^2]$
(c) $m[v_1 + v_2]$ (d) $m[v_2 - v_1]$ *(1990)*

53. A 600 kg rocket is set for a vertical fring. If the exhaust speed is $1000\ ms^{-1}$, the mass of the gas ejected per second to supply the thrust needed to overcome the weight of rocket is
(a) $117.6\ kgs^{-1}$ (b) $58.6\ kgs^{-1}$
(c) $6\ kgs^{-1}$ (d) $76.4\ kgs^{-1}$ *(1990)*

54. A body of mass 5 kg explodes at rest into three fragments with masses in the ratio 1 : 1 : 3. The fragments with equal masses fly in mutually perpendicular directions with speeds of 21 m/s. The velocity of heaviest fragment in m/s will be
(a) $7\sqrt{2}$ (b) $5\sqrt{2}$
(c) $3\sqrt{2}$ (d) $\sqrt{2}$ *(198*

55. Starting from rest, a body slides down a 45° inclined plane in twice the time it takes to slide down the same distance in the absence of friction. The coefficient of friction between the body and the inclined plane is
(a) 0.80 (b) 0.75
(c) 0.25 (d) 0.33 *(198*

EXPLANATIONS

1. (c) : Let v be tangential speed of heavier stone. Then, centripetal force experienced by lighter stone is $(F_c)_{lighter} = \frac{m(nv)^2}{r}$
and that of heavier stone is

$$(F_c)_{heavier} = \frac{2mv^2}{(r/2)}$$

But $(F_c)_{lighter} = (F_c)_{heavier}$ (given)

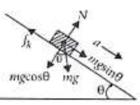
$$\therefore \quad \frac{m(nv)^2}{r} = \frac{2mv^2}{(r/2)}$$

$$n^2\left(\frac{mv^2}{r}\right) = 4\left(\frac{mv^2}{r}\right)$$

$n^2 = 4$ or $n = 2$

2. (d) : Let μ_s and μ_k be the coefficients of static and kinetic friction between the box and the plank respectively.
When the angle of inclination θ reaches 30°, the block just slides,

$$\therefore \quad \mu_s = \tan\theta = \tan 30° = \frac{1}{\sqrt{3}} = 0.6$$



If a is the acceleration produced in the block, then
$ma = mg\sin\theta - f_k$
(where f_k is force of kinetic friction)
$= mg\sin\theta - \mu_k N$ (as $f_k = \mu_k N$)
$= mg\sin\theta - \mu_k mg\cos\theta$ (as $N = mg\cos\theta$)
$a = g(\sin\theta - \mu_k\cos\theta)$
As $g = 10\ ms^{-2}$ and $\theta = 30°$
$\therefore\ a = (10\ ms^{-2})(\sin 30° - \mu_k\cos 30°)$ ...(i)
If s is the distance travelled by the block in time t, then

$s = \frac{1}{2}at^2$ (as $u = 0$)

or $a = \frac{2s}{t^2}$

But $s = 4.0$ m and $t = 4.0$ s (given)

$$\therefore \quad a = \frac{2(4.0\ m)}{(4.0\ s)^2} = \frac{1}{2}\ ms^{-2}$$

Substituting this value of a in eqn. (i), we get

$$\frac{1}{2}\ ms^{-2} = (10\ ms^{-2})\left(\frac{1}{2} - \mu_k\frac{\sqrt{3}}{2}\right)$$

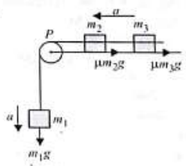
$$\frac{1}{10} = 1 - \sqrt{3}\mu_k \text{ or } \sqrt{3}\mu_k = 1 - \frac{1}{10} = \frac{9}{10} = 0.9$$

$$\mu_k = \frac{0.9}{\sqrt{3}} = 0.5$$

3. (d) : $F = 14$ N 
Here, $M_A = 4$ kg, $M_B = 2$ kg, $M_C = 1$ kg, $F = 14$ N
Net mass, $M = M_A + M_B + M_C = 4 + 2 + 1 = 7$ kg
Let a be the acceleration of the system.
Using Newton's second law of motion,
$F = Ma$
$14 = 7a \quad \therefore \quad a = 2\ m\ s^{-2}$
Let F' be the force applied on block A by block B *i.e.* the contact force between A and B. Free body diagram for block A
Again using Newton's second law of motion,
$F - F' = 4a$
$14 - F' = 4 \times 2 \Rightarrow 14 - 8 = F' \quad \therefore \quad F' = 6$ N

4. (a)

5. (c) :



Force of friction on mass $m_2 = \mu m_2 g$
Force of friction on mass $m_3 = \mu m_3 g$
Let a be common acceleration of the system.

$$\therefore \quad a = \frac{m_1 g - \mu m_2 g - \mu m_3 g}{m_1 + m_2 + m_3}$$

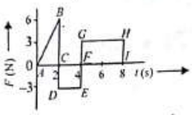
Here, $m_1 = m_2 = m_3 = m$

$\therefore \quad a = \dfrac{mg - \mu mg - \mu mg}{m + m + m} = \dfrac{mg - 2\mu mg}{3m}$

$= \dfrac{g(1-2\mu)}{3}$

Hence, the downward acceleration of mass m_1 is $\dfrac{g(1-2\mu)}{3}$.

6. (c) :



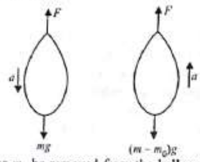
Change in momentum = Area under F-t graph in that interval

= Area of ΔABC − Area of rectangle $CDEF$ + Area of rectangle $FGHI$

$= \frac{1}{2} \times 2 \times 6 - 3 \times 2 + 4 \times 3 = 12$ N s

7. (a) : Let F be the upthrust of the air. As the balloon is descending down with an acceleration a,

$\therefore \; mg - F = ma$ ... (i)



Let mass m_0 be removed from the balloon so that it starts moving up with an acceleration a. Then,

$F - (m - m_0)g = (m - m_0)a$

$F - mg + m_0 g = ma - m_0 a$ ... (ii)

Adding eqn. (i) and eqn. (ii), we get

$m_0 g = 2ma - m_0 a$

$m_0 g + m_0 a = 2ma$

$m_0(g + a) = 2ma$

$m_0 = \dfrac{2ma}{a+g}$

8. (c) : Let T_1 be tension in string connecting m and $2m$ and T_2 be tension in string connecting $2m$ and $3m$.

Let a be common acceleration of the system.

$\therefore \quad a = \dfrac{F - (m + 2m + 3m)g}{m + 2m + 3m} = \dfrac{F - 6mg}{6m}$

As the system moves with constant speed therefore, $a = 0$

$\therefore \; F - 6mg = 0$ or $F = 6mg$

The free body diagram of block m is as shown in the figure.

The equation of motion of block of mass m is

$F - T_1 - mg = 0$

$6mg - T_1 - mg = 0$

$T_1 = 5mg$

The free body diagram of block of mass $2m$ is as shown in the figure.

The equation of motion of block of mass $2m$ is

$T_1 - T_2 - 2mg = 0$

$5mg - T_2 - 2mg = 0$ (Using (i))

$T_2 = 3mg$

The free body diagram of block of mass $3m$ is as shown in the figure.

The equation of motion of block of mass $3m$ is

$T_2 - 3mg = 0$

$T_2 = 3mg$

Net force on the block of mass $2m$ is

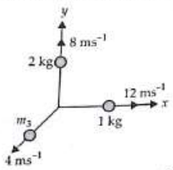
$F_{net} = T_1 - T_2 - 2mg$

$= 5mg - 3mg - 2mg = 0$

Alternate solution

As all blocks are moving with constant speed therefore, acceleration is zero. So net force on each block is zero.

9. (d) : The situation is as shown in the figure.



According to law of conservation of linear momentum

$\vec{p}_1 + \vec{p}_2 + \vec{p}_3 = 0 \quad \therefore \; \vec{p}_3 = -(\vec{p}_1 + \vec{p}_2)$

Here,

$\vec{p}_1 = (1\text{ kg})(12\text{ ms}^{-1})\hat{i} = 12\hat{i}\text{ kg ms}^{-1}$

$\vec{p}_2 = (2\text{ kg})(8\text{ ms}^{-1})\hat{j} = 16\hat{j}\text{ kg ms}^{-1}$

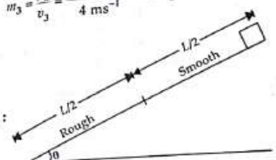
$\therefore \; \vec{p}_3 = -(12\hat{i} + 16\hat{j})\text{ kg ms}^{-1}$

The magnitude of p_3 is

$p_3 = \sqrt{(12)^2 + (16)^2} = 20\text{ kg ms}^{-1}$

$\therefore \; m_3 = \dfrac{p_3}{v_3} = \dfrac{20\text{ kg ms}^{-1}}{4\text{ ms}^{-1}} = 5\text{ kg}$

10. (a) :



Let m be mass of the block and L be length of the inclined plane.

According to work-energy theorem

$W = \Delta K = 0$

(Initial and final speeds are zero)

$\therefore$ Work done by friction + Work done by gravity = 0

$-\mu mg\cos\theta \dfrac{L}{2} + mg\sin\theta L = 0$

$\dfrac{\mu}{2}\cos\theta = \sin\theta$

$\mu = \dfrac{2\sin\theta}{\cos\theta} = 2\tan\theta$

Alternate solution

For upper half smooth plane

Acceleration of the block, $a = g\sin\theta$

Here, $u = 0$ (block starts from rest)

$a = g\sin\theta, \; s = \dfrac{L}{2}$

Using, $v^2 - u^2 = 2as$, we have

$v^2 - 0 = 2 \times g\sin\theta \times \dfrac{L}{2}$

$v = \sqrt{gL\sin\theta}$ ...(i)

For lower half rough plane

Acceleration of the block, $a' = g\sin\theta - \mu g\cos\theta$

where μ is the coefficient of friction between the block and lower half of the plane

Here, $u = v = \sqrt{gL\sin\theta}$,

$v = 0$ (block comes to rest)

$a = a' = g\sin\theta - \mu g\cos\theta, \; s = \dfrac{L}{2}$

Again, using $v^2 - u^2 = 2as$, we have

$0 - (\sqrt{gL\sin\theta})^2 = 2 \times (g\sin\theta - \mu g\cos\theta) \times \dfrac{L}{2}$

$-gL\sin\theta = (g\sin\theta - \mu g\cos\theta)L$

$-\sin\theta = \sin\theta - \mu\cos\theta$

$\mu\cos\theta = 2\sin\theta$

$\mu = 2\tan\theta$

11. (c) : Let θ is the angle made by the wire with the vertical.

$\therefore \; \tan\theta = \dfrac{v^2}{rg}$

Here, $v = 10$ m/s, $r = 10$ m, $g = 10\text{ m/s}^2$

$\therefore \; \tan\theta = \dfrac{(10\text{ m/s})^2}{10\text{ m}(10\text{ m/s}^2)} = 1$

$\theta = \tan^{-1}(1) = \dfrac{\pi}{4}$

12. (b)

13. (b) : When a stone is dropped from a height h, it hits the ground with a momentum

$P = m\sqrt{2gh}$ ...(i)

where m is the mass of the stone.

When the same stone is dropped from a height $2h$ (*i.e.* 100% of initial), then its momentum with which it hits the ground becomes

$P' = m\sqrt{2g(2h)} = \sqrt{2}P$ (Using (i)) ...(ii)

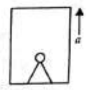
% change in momentum $= \dfrac{P' - P}{P} \times 100\%$

$= \dfrac{\sqrt{2}P - P}{P} \times 100\% = 41\%$

14. (c) : Here, Mass of a person, $m = 60$ kg

Mass of lift, $M = 940$ kg,

$a = 1\text{ m/s}^2, g = 10\text{ m/s}^2$



Let T be the tension in the supporting cable.

$\therefore \; T - (M + m)g = (M + m)a$

$T = (M + m)(a + g)$

$= (940 + 60)(1 + 10) = 11000$ N

15. (c) : Impulse = Change in linear momentum

$= MV - (-MV) = 2MV$

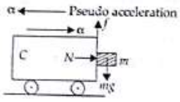
16. (a) : Force of friction, $f = \mu mg$

$\therefore\ a = \frac{f}{m} = \frac{\mu mg}{m} = \mu g = 0.5 \times 10 = 5\ \text{m s}^{-2}$

Using $v^2 - u^2 = 2aS$

$0^2 - 2^2 = 2(-5) \times S \Rightarrow\ S = 0.4$ m

17. (c) :



Pseudo force or fictitious force, $F_{fic} = m\alpha$

Force of friction, $f = \mu N = \mu m\alpha$

The block of mass m will not fall as long as

$f \geq mg$

$\mu m\alpha \geq mg$

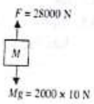
$\alpha \geq \frac{g}{\mu}$

18. (a) : $F - Mg = Ma$

$8000 = 2000a$

$\therefore$ Acceleration is

$4\ \text{ms}^{-2}$ upwards.



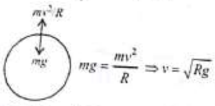
19. (c) : $\vec{F} = 6\hat{i} - 8\hat{j} + 10\hat{k}$

$|\vec{F}| = \sqrt{36+64+100} = \sqrt{200}\ \text{N} = 10\sqrt{2}$ N.

Acceleration, $a = 1\ \text{ms}^{-2}$

$\therefore$ Mass, $M = \frac{10\sqrt{2}}{1} = 10\sqrt{2}$ kg.

20. (c) :

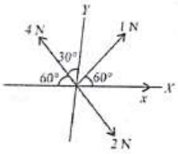


$mg = \frac{mv^2}{R} \Rightarrow v = \sqrt{Rg}$

$v = \sqrt{20 \times 10} = \sqrt{200} = 14.1$ m/s

i.e., Between 14 and 15 m/s.

21. (c) :



Taking x-components, the total should be zero.

$1 \times \cos 60° + 2\cos 60° + x - 4\cos 60° = 0$

$\therefore\ x = 0.5$ N

22. (c) : $F = \frac{d}{dt}(Mv) = v\frac{dM}{dt} + M\frac{dv}{dt}$

As v is a constant,

$F = v\frac{dM}{dt}$. But $\frac{dM}{dt} = M$ kg/s

$\therefore$ To keep the conveyer belt moving at v m/s, force needed $= vM$ newton.

23. (d) : Given $u = V$, final velocity = 0.

Using $v = u + at$

$\therefore\ 0 = V - at$ or, $-a = \frac{0 - V}{t} = -\frac{V}{t}$

$f = \mu R = \mu mg$ (f is the force of friction)

$\therefore$ Retardation, $a = \mu g$

$\therefore\ t = \frac{V}{a} = \frac{V}{\mu g}$.

24. (c) : Components of momentum parallel to the wall add each other and components of momentum in the perpendicular to the wall are opposite to each other. Therefore change of momentum is final momentum – initial momentum

i.e., $mv\sin\theta$ after collision

$-(-mv\sin\theta)$ before collision)

$F \times t$ = change in momentum

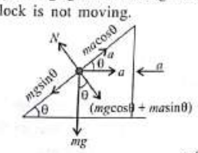
$= 2mv\sin\theta$

$\therefore\ F = \frac{2mv\sin\theta}{t}$

$= \frac{2 \times 0.5 \times 12 \times \sin 30°}{0.25} = 48 \times \frac{1}{2} = 24$ N.

25. (d) : The wedge is given an acceleration to the left.

$\therefore$ The block has a pseudo acceleration to the right, pressing against the wedge because of which the block is not moving.



$\therefore\ mg\sin\theta = ma\cos\theta$ or $a = \frac{g\sin\theta}{\cos\theta}$

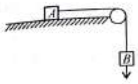
Total reaction of the wedge on the block is

$N = mg\cos\theta + ma\sin\theta$.

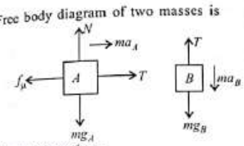
or $N = mg\cos\theta + \frac{mg\sin\theta \cdot \sin\theta}{\cos\theta}$

or $N = \frac{mg(\cos^2\theta + \sin^2\theta)}{\cos\theta} = \frac{mg}{\cos\theta}$.

26. (d) :



Free body diagram of two masses is



We get equations

$T + ma = f_\mu$ or $T = \mu N_A$ (for $a = 0$)

and $T = ma + mg$ or $T = m_B g$ (for $a = 0$)

$\therefore\ \mu N_A = m_B g \Rightarrow m_B = \mu m_A = 0.2 \times 2 = 0.4$ kg.

27. (d) : When the lift is accelerating upwards with acceleration a, then reading on the scale

$R = m(g + a) = 80\,(10 + 5)\ \text{N} = 1200$ N.

28. (d) : Let T be the tension in the rope when monkey climbs up with an acceleration a. Then,

$T - mg = ma$

$25\,g - 20\,g = 20\,a\ \Rightarrow\ a = \frac{5 \times 10}{20} = 2.5\ \text{m/s}^2$.

29. (b) : For a lift which is moving in upward direction with an acceleration a, the tension T developed in the string connected to the lift is given by

$T = m\,(g + a)$.

Here $m = 1000$ kg, $a = 1\ \text{m/s}^2$, $g = 9.8\ \text{m/s}^2$

$\therefore\ T = 1000(9.8 + 1) = 10{,}800$ N.

30. (b) : $m = 10$ kg,

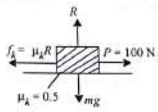
$R = mg$

$\therefore$ Frictional force $= f_k$

$= \mu_k R = \mu_k mg$

$= 0.5 \times 10 \times 10$

$= 50$ N [$g = 10\ \text{m/sec}^2$]



$\therefore$ Net force acting on the body $= F = P - f_k$

$= 100 - 50 = 50$ N.

$\therefore$ Acceleration of the block $= a = F/m$

$= 50/10 = 5\ \text{m/sec}^2$.

31. (c) : Load $W = Mg = 75 \times 10 = 750$ N

Effort (P) = 250 N

$\therefore$ Mechanical advantage

$= \frac{\text{load}}{\text{effort}} = \frac{W}{P} = \frac{750}{250} = 3$.

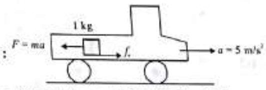
Velocity ratio

$= \frac{\text{distance travelled by effort}}{\text{distance travelled by load}} = \frac{12}{3} = 4$

Efficiency, $\eta = \frac{\text{Mechanical advantage}}{\text{Velocity ratio}}$

$= (3/4) \times 100 = 75\%$.

32. (a) :



$f_{rL} = \mu_s N = \mu_s \times mg = 0.6 \times 1 \times 10 = 6$ N.

where f_{rL} is the force of limiting friction.

Pseudo force $= ma = 1 \times 5$; $F = 5$ N

If $F < f_{rL}$ block does not move. So static friction is present.

Static friction = applied force . $\therefore\ f_r = 5$ N.

33. (b) : Impulse = Change in momentum

$F \cdot \Delta t = m \cdot v$;

$F = \frac{m \cdot v}{\Delta t} = \frac{150 \times 10^{-3} \times 20}{0.1} = 30$ N.

34. (a) : Apply conservation of linear momentum.

Total momentum before explosion

= total momentum after explosion

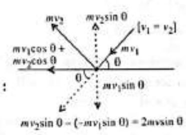
$0 = \frac{m}{5}v_1\hat{i} + \frac{m}{5}v_2\hat{j} + \frac{3m}{5}\vec{v}_3$;

$\frac{3m}{5}\vec{v}_3 = -\frac{m}{5}[v_1\hat{i} + v_2\hat{j}]$

$\vec{v}_3 = \frac{-v_1}{3}\hat{i} - \frac{v_2}{3}\hat{j}$ $\quad \because\ v_1 = v_2 = 30$ m/sec.

$\vec{v}_3 = -10\hat{i} - 10\hat{j}$; $v_3 = 10\sqrt{2}$ m/sec.

35. (a) :



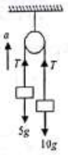
Change in momentum $= 2 \times 3 \times 10 \times \sin 60°$

$$= 60 \times \frac{\sqrt{3}}{2}$$

Force = Change in momentum/Impact time

$$= \frac{30\sqrt{3}}{0.2} = 150\sqrt{3}\text{ N}$$

36. (b) : The force equations are



$T - 5g = 5a$,

$10g - T = 10a$

Adding, $10g - 5g = 15a$

or, $a = \frac{5g}{15} = \frac{g}{3}$.

37. (c) : Force $= \frac{d}{dt}$(momentum)

$$= \frac{d}{dt}(mv) = v\left(\frac{dm}{dt}\right) \Rightarrow 210 = 300\left(\frac{dm}{dt}\right)$$

$\frac{dm}{dt}$ = rate of combustion $= \frac{210}{300} = 0.7$ kg/s

38. (c) : Upward acceleration, $ma = T_1 - mg$

$T_1 = m(g + a)$

Downward acceleration, $ma = mg - T_2$

or, $T_2 = m(g - a)$

$$\frac{T_1}{T_2} = \frac{g+a}{g-a} = \frac{9.8+4.9}{9.8-4.9} = 3:1.$$

39. (d) : When $F = 0$, $600 - 2 \times 10^5 t = 0$

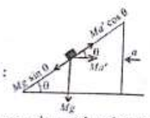
$$\therefore t = \frac{600}{2\times10^5} = 3\times10^{-3}\text{s}.$$

Now, impulse, $I = \int_0^t F dt = \int_0^t (600 - 2\times10^5 t)dt$

$$600t - 2\times10^5\frac{t^2}{2} = 600 \times 3 \times 10^{-3} - 10^5 \times (3 \times 10^{-3})^2$$

or, $I = 1.8 - 0.9 = 0.9$ N-s.

40. (a) :



The pseudo acceleration for the body $a' = a$

If the pseudo force $Ma\cos\theta = Mg\sin\theta$, then the body will be at rest, $a = g\tan\theta$.

This horizontal acceleration should be applied to the wedge to the left.

41. (b) : Thrust $= M(g + a) = u\frac{dm}{dt}$

$$\frac{dm}{dt} = \frac{M(g+a)}{u} = \frac{5000(10+20)}{800} = 187.5\text{ kg/s}$$

42. (b) : Force $(F) = 6$ N; Initial velocity $(u) = 0$; Mass $(m) = 1$ kg and final velocity $(v) = 30$ m/s.

Therefore acceleration $(a) = \frac{F}{m} = \frac{6}{1} = 6$ m/s² and final velocity $(v) = 30 = u + at = 0 + 6 \times t$ or $t = 5$ seconds.

43. (c) : Force $(F) = 10$ N and acceleration $(a) = 1$ m/s².

Mass $(m) = \frac{F}{a} = \frac{10}{1} = 10$ kg.

44. (c) : Force $(\vec{F}) = 6\hat{i} - 8\hat{j} + 10\hat{k}$ and acceleration $(a) = 1$ m/s².

$$\text{Mass }(m) = \frac{|\vec{F}|}{a} = \frac{|6\hat{i} - 8\hat{j} + 10\hat{k}|}{1}$$

$$= \sqrt{36+64+100} = \sqrt{200} = 10\sqrt{2}\text{ kg.}$$

45. (a) : Mass of bullet $(m_1) = 200$ gm $= 0.2$ kg; Speed of bullet $(v_1) = 5$ m/sec. and mass of gun $(m_2) = 1$ kg. Before firing, total momentum is zero.

$\therefore$ After firing total momentum is $m_1v_1 + m_2v_2$

From the law of conservation of momentum

$m_1v_1 + m_2v_2 = 0$

or $v_2 = \frac{-m_1v_1}{m_2} = \frac{-0.2\times5}{1} = -1$ m/sec.

46. (b) : Rate of burning of fuel $\left(\frac{dm}{dt}\right) = 1$ kg/s and velocity of ejected fuel $(v) = 60$ km/s $= 60 \times 10^3$ m/s.

Force = Rate of change of momentum

$$= \frac{dp}{dt} = \frac{d(mv)}{dt} = v\frac{dm}{dt} = (60 \times 10^3) \times 1 = 60000\text{ N.}$$

47. (d) : The acceleration is nullified by force of kinetic friction/mass

$mg\sin\theta$ is force downwards.

μ_k is the coefficient of kinetic friction.

$\mu_k mg\cos\theta$ is force acting upwards.

$\therefore mg\sin\theta - \mu_k mg\cos\theta$ = mass × acceleration.

acceleration = 0 as v is constant

$\therefore \mu_k = \tan\theta$.

48. (c) : Let T be the tension in the branch of a tree when monkey is decending with acceleration a

Thus, $mg - T = ma$

also, $T = 75\%$ of weight of monkey

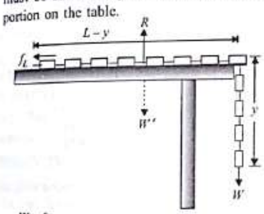
$$T = \left(\frac{75}{100}\right)mg = \frac{3}{4}mg$$

$$\therefore ma = mg - \left(\frac{3}{4}\right)mg = \frac{1}{4}mg \text{ or } a = \frac{g}{4}$$

49. (b)

50. (c) : Newton's first law of motion is related to physical independence of force.

51. (a) : Let M is the mass of the chain of length L. If y is the maximum length of chain which can hang outside the table without sliding, then for equilibrium of the chain, the weight of hanging part must be balanced by the force of friction on the portion on the table.



$W = f_L$ .....(i)

But from figure

$$W = \frac{M}{L}yg \text{ and } R = W' = \frac{M}{L}(L-y)g$$

So that

$$f_L = \mu R = \mu\frac{M}{L}(L-y)g$$

Substituting these values of W and f_L in eqn.(i),

we get $\mu\frac{M}{L}(L-y)g = \frac{M}{L}yg$

or $\mu(L-y) = y$ or $y = \frac{\mu L}{\mu+1} = \frac{0.25L}{1.25} = \frac{L}{5}$

or $\frac{y}{L} = \frac{1}{5} = \frac{1}{5} \times 100\% = 20\%$

52. (d) : Impulse is a vector quantity and is equal to change in momentum of the body thus, (same as $F \times t$ where t is short)

$$\text{Impulse} = mv_2 - mv_1 = m(v_2 - v_1)$$

53. (c) : Thrust is the force with which the rocket moves upward given by

$$F = u\frac{dm}{dt}$$

Thus mass of the gas ejected per second to supply the thrust needed to overcome the weight of the rocket is

$$\frac{dm}{dt} = \frac{F}{u} = \frac{m\times a}{u} \text{ or } \frac{dm}{dt} = \frac{600\times10}{1000} = 6\text{ kgs}^{-1}$$

54. (a) : Since 5 kg body explodes into three fragments with masses in the ratio 1 : 1 : 3 thus, masses of fragments will be 1 kg, 1 kg and 3 kg respectively. The magnitude of resultant momentum of two fragments each of mass 1 kg, moving with velocity 21 m/s, in perpendicular directions is

$$\sqrt{(m_1v_1)^2 + (m_2v_2)^2}$$

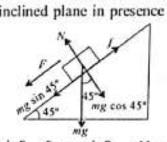
$$m'v' = \sqrt{(21)^2 + (21)^2} = 21\sqrt{2}\text{ kg m/s}$$

According to law of conservation of linear momentum

$m_3v_3 = m'v' = 21\sqrt{2}$ or $3v_3 = 21\sqrt{2}$

or $v_3 = 7\sqrt{2}$ m/s

55. (b) : The various forces acting on the body have been shown in the figure. The force on the body down the inclined plane in presence of friction μ is



$$F = mg\sin\theta - f = mg\sin\theta - \mu N = ma$$

or $a = g\sin\theta - \mu g\cos\theta$.

Since block is at rest thus initial velocity $u = 0$

$\therefore$ Time taken to slide down the plane

$$t_1 = \sqrt{\frac{2s}{a}} = \sqrt{\frac{2s}{g\sin\theta - \mu g\cos\theta}}$$

In absence of friction time taken will be $t_2 = \sqrt{\frac{2s}{g\sin\theta}}$

Given : $t_1 = 2t_2$.

$$\therefore t_1^2 = 4t_2^2 \text{ or } \frac{2s}{g(\sin\theta - \mu\cos\theta)} = \frac{2s\times4}{g(\sin\theta)}$$

or $\sin\theta = 4\sin\theta - 4\mu\cos\theta$ or $\mu = \frac{3}{4}\tan\theta = 0.75$

CHAPTER

5 Work, Energy and Power

1. Two particles A and B, move with constant velocities $\vec{v}_1$ and $\vec{v}_2$. At the initial moment their position vectors are $\vec{r}_1$ and $\vec{r}_2$ respectively. The condition for particles A and B for their collision is
(a) $\vec{r}_1 \times \vec{v}_1 = \vec{r}_2 \times \vec{v}_2$
(b) $\vec{r}_1 - \vec{r}_2 = \vec{v}_1 - \vec{v}_2$
(c) $\dfrac{\vec{r}_1 - \vec{r}_2}{|\vec{r}_1 - \vec{r}_2|} = \dfrac{\vec{v}_2 - \vec{v}_1}{|\vec{v}_2 - \vec{v}_1|}$
(d) $\vec{r}_1 \cdot \vec{v}_1 = \vec{r}_2 \cdot \vec{v}_2$ *(AIPMT 2015)*

2. The heart of a man pumps 5 litres of blood through the arteries per minute at a pressure of 150 mm of mercury. If the density of mercury be 13.6×10^3 kg/m^3 and $g = 10$ m/s^2 then the power
(a) 3.0 (b) 1.50
(c) 1.70 (d) 2.35 *(AIPMT 2015)*

3. A ball is thrown vertically downwards from a height of 20 m with an initial velocity v_0. It collides with the ground, loses 50 percent of its energy in collision and rebounds to the same height. The initial velocity v_0 is (Take $g = 10$ ms^{-2})
(a) 28 ms^{-1} (b) 10 ms^{-1}
(c) 14 ms^{-1} (d) 20 ms^{-1}
(AIPMT 2015)

4. On a frictionless surface, a block of mass M moving at speed v collides elastically with another block of same mass M which is initially at rest. After collision the first block moves at an angle θ to its initial direction and has a speed $\frac{v}{3}$. The second block's speed after the collision is
(a) $\frac{3}{\sqrt{2}}v$ (b) $\frac{\sqrt{3}}{2}v$
(c) $\frac{2\sqrt{2}}{3}v$ (d) $\frac{3}{4}v$
(AIPMT 2015)

5. A particle of mass m is driven by a machine that delivers a constant power k watts. If the particle starts from rest the force on the particle at time t is
(a) $\sqrt{2mk}\,t^{-1/2}$ (b) $\frac{1}{2}\sqrt{mk}\,t^{-1/2}$
(c) $\sqrt{\frac{mk}{2}}\,t^{-1/2}$ (d) $\sqrt{mk}\,t^{-1/2}$
(AIPMT 2015, Cancelled)

6. A block of mass 10 kg, moving in x direction with a constant speed of 10 m s^{-1}, is subjected to a retarding force $F = 0.1x$ J/m during its travel from $x = 20$ m to 30 m. Its final KE will be
(a) 275 J (b) 250 J
(c) 475 J (d) 450 J
(AIPMT 2015, Cancelled)

7. Two particles of masses m_1, m_2 move with initial velocities u_1 and u_2. On collision, one of the particles get excited to higher level, after absorbing energy ε. If final velocities of particles be v_1 and v_2 then we must have
(a) $\frac{1}{2}m_1u_1^2 + \frac{1}{2}m_2u_2^2 - \varepsilon = \frac{1}{2}m_1v_1^2 + \frac{1}{2}m_2v_2^2$
(b) $\frac{1}{2}m_1^2u_1^2 + \frac{1}{2}m_2^2u_2^2 + \varepsilon = \frac{1}{2}m_1^2v_1^2 + \frac{1}{2}m_2^2v_2^2$
(c) $m_1^2u_1 + m_2^2u_2 - \varepsilon = m_1^2v_1 + m_2^2v_2$
(d) $\frac{1}{2}m_1u_1^2 + \frac{1}{2}m_2u_2^2 = \frac{1}{2}m_1v_1^2 + \frac{1}{2}m_2v_2^2 - \varepsilon$
(AIPMT 2015, Cancelled)

8. Two similar springs P and Q have spring constants K_P and K_Q, such that $K_P > K_Q$. They are stretched first by the same amount (case a), then by the same force (case b). The work done by the springs W_P and W_Q are related as, in case (a) and case (b) respectively
(a) $W_P > W_Q$; $W_Q > W_P$
(b) $W_P < W_Q$; $W_Q < W_P$

(c) $W_P = W_Q$; $W_P > W_Q$
(d) $W_P = W_Q$; $W_P = W_Q$
(AIPMT 2015, Cancelled)

9. A body of mass $(4m)$ is lying in x-y plane at rest. It suddenly explodes into three pieces. Two pieces, each of mass (m) move perpendicular to each other with equal speeds (v). The total kinetic energy generated due to explosion is
(a) mv^2 (b) $\frac{3}{2}mv^2$
(c) $2mv^2$ (d) $4mv^2$
(AIPMT 2014)

10. A uniform force of $(3\hat{i} + \hat{j})$ newton acts on a particle of mass 2 kg. Hence the particle is displaced from position $(2\hat{i} + \hat{k})$ meter to position $(4\hat{i} + 3\hat{j} - \hat{k})$ meter. The work done by the force on the particle is
(a) 13 J (b) 15 J
(c) 9 J (d) 6 J *(NEET 2013)*

11. A particle with total energy E is moving in a potential energy region $U(x)$. Motion of the particle is restricted to the region when
(a) $U(x) < E$ (b) $U(x) = 0$
(c) $U(x) \leq E$ (d) $U(x) > E$
(Karnataka NEET 2013)

12. One coolie takes 1 minute to raise a suitcase through a height of 2 m but the second coolie takes 30 s to raise the same suitcase to the same height. The powers of two coolies are in the ratio
(a) 1 : 3 (b) 2 : 1
(c) 3 : 1 (d) 1 : 2
(Karnataka NEET 2013)

13. The potential energy of a particle in a force field is
$$U = \frac{A}{r^2} - \frac{B}{r}$$
where A and B are positive constants and r is the distance of particle from the centre of the field. For stable equilibrium, the distance of the particle is
(a) $\frac{B}{2A}$ (b) $\frac{2A}{B}$
(c) $\frac{A}{B}$ (d) $\frac{B}{A}$
(Prelims 2012)

14. A solid cylinder of mass 3 kg is rolling on a horizontal surface with velocity 4 m s^{-1}. It collides with a horizontal spring of force constant 200 N m^{-1}. The maximum compression produced in the spring will be
(a) 0.5 m (b) 0.6 m
(c) 0.7 m (d) 0.2 m
(Prelims 2012)

15. Two spheres A and B of masses m_1 and m_2 respectively collide. A is at rest initially and B is moving with velocity v along x-axis. After collision B has a velocity in a direction perpendicular to the original direction. The mass A moves after collision in the direction
(a) same as that of B
(b) opposite to that of B
(c) $\theta = \tan^{-1}\left(\frac{1}{2}\right)$ to the x-axis
(d) $\theta = \tan^{-1}\left(-\frac{1}{2}\right)$ to the x-axis *(Prelims 2012)*

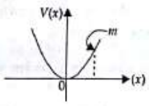
16. A car of mass m starts from rest and accelerates so that the instantaneous power delivered to the car has a constant magnitude P_0. The instantaneous velocity of this car is proportional to
(a) t^2P_0 (b) $t^{1/2}$
(c) $t^{-1/2}$ (d) $\frac{t}{\sqrt{m}}$ *(Mains 2012)*

17. The potential energy of a system increases if work is done
(a) upon the system by a nonconservative force.
(b) by the system against a conservative force.
(c) by the system against a nonconservative force.
(d) upon the system by a conservative force.
(Prelims 2011)

18. A body projected vertically from the earth reaches a height equal to earth's radius before returning to the earth. The power exerted by the gravitational force is greatest
(a) at the highest position of the body.
(b) at the instant just before the body hits the earth.
(c) it remains constant all through.
(d) at the instant just after the body is projected.
(Prelims 2011)

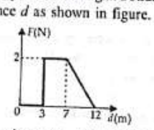
19. A particle of mass m is released from rest and follows a parabolic path as shown. Assuming that

the displacement of the mass from the origin is small, which graph correctly depicts the position of the particle as a function of time?



(a) 
(b) 
(c) 
(d) 
(Prelims 2011)

20. Force F on a particle moving in a straight line varies with distance d as shown in figure.



The work done on the particle during its displacement of 12 m is

(a) 18 J (b) 21 J

(c) 26 J (d) 13 J *(Prelims 2011)*

21. A mass m moving horizontally (along the x-axis) with velocity v collides and sticks to a mass of $3m$ moving vertically upward (along the y-axis) with velocity $2v$. The final velocity of the combination is

(a) $\frac{3}{2}v\hat{i}+\frac{1}{4}v\hat{j}$ (b) $\frac{1}{4}v\hat{i}+\frac{3}{2}v\hat{j}$

(c) $\frac{1}{3}v\hat{i}+\frac{2}{3}v\hat{j}$ (d) $\frac{2}{3}v\hat{i}+\frac{1}{3}v\hat{j}$

(Mains 2011)

22. A ball moving with velocity 2 m/s collides head on with another stationary ball of double the mass. If the coefficient of restitution is 0.5, then their velocities (in m/s) after collision will be

(a) 0, 1 (b) 1, 1

(c) 1, 0.5 (d) 0, 2 *(Prelims 2010)*

23. An engine pumps water through a hose pipe. Water passes through the pipe and leaves it with a velocity of 2 m/s. The mass per unit length of water in the pipe is 100 kg/m. What is the power of the engine?

(a) 400 W (b) 200 W

(c) 100 W (d) 800 W *(Prelims 2010)*

24. A particle of mass M, starting from rest, undergoes uniform acceleration. If the speed acquired in time T is V, the power delivered to the particle is

(a) $\frac{MV^2}{T}$ (b) $\frac{1}{2}\frac{MV^2}{T^2}$

(c) $\frac{MV^2}{T^2}$ (d) $\frac{1}{2}\frac{MV^2}{T}$

(Mains 2010)

25. A block of mass M is attached to the lower end of a vertical spring. The spring is hung from a ceiling and has force constant value k. The mass is released from rest with the spring initially unstretched. The maximum extension produced in the length of the spring will be

(a) $2Mg/k$ (b) $4Mg/k$

(c) $Mg/2k$ (d) Mg/k *(Prelims 2009)*

26. A body of mass 1 kg is thrown upwards with a velocity 20 m/s. It momentarily comes to rest after attaining a height of 18 m. How much energy is lost due to air friction? (g = 10 m/s^2)

(a) 30 J (b) 40 J

(c) 10 J (d) 20 J *(Prelims 2009)*

27. An explosion blows a rock into three parts. Two parts go off at right angles to each other. These two are, 1 kg first part moving with a velocity of 12 ms^{-1} and 2 kg second part moving with a velocity of 8 ms^{-1}. If the third part flies off with a velocity of 4 ms^{-1}, its mass would be

(a) 7 kg (b) 17 kg

(c) 3 kg (d) 5 kg *(Prelims 2009)*

28. An engine pumps water continuously through a hose. Water leaves the hose with a velocity v and m is the mass per unit length of the water jet. What is the rate at which kinetic energy is imparted to water?

(a) mv^3 (b) $\frac{1}{2}mv^2$

(c) $\frac{1}{2}m^2v^2$ (d) $\frac{1}{2}mv^3$ *(Prelims 2009)*

29. A shell of mass 200 gm is ejected from a gun of mass 4 kg by an explosion that generates 1.05 kJ of energy. The initial velocity of the shell is

(a) 40 ms^{-1} (b) 120 ms^{-1}

(c) 100 ms^{-1} (d) 80 ms^{-1}

(Prelims 2008)

30. Water falls from a height of 60 m at the rate of 15 kg/s to operate a turbine. The losses due to frictional forces are 10% of energy. How much power is generated by the turbine ? (g = 10 m/s^2)

(a) 12.3 kW (b) 7.0 kW

(c) 8.1 kW (d) 10.2 kW

(Prelims 2008)

31. A vertical spring with force constant k is fixed on a table. A ball of mass m at a height h above the free upper end of the spring falls vertically on the spring so that the spring is compressed by a distance d. The net work done in the process is

(a) $mg(h+d)-\frac{1}{2}kd^2$ (b) $mg(h-d)-\frac{1}{2}kd^2$

(c) $mg(h-d)+\frac{1}{2}kd^2$ (d) $mg(h+d)+\frac{1}{2}kd^2$.

(2007)

32. 300 J of work is done in sliding a 2 kg block up an inclined plane of height 10 m. Work done against friction is (Take g = 10 m/s^2)

(a) 1000 J (b) 200 J

(c) 100 J (d) zero. *(2006)*

33. The potential energy of a long spring when stretched by 2 cm is U. If the spring is stretched by 8 cm the potential energy stored in it is

(a) U/4 (b) 4U

(c) 8U (d) 16U. *(2006)*

34. A body of mass 3 kg is under a constant force which causes a displacement s in metres in it, given by the relation $s=\frac{1}{3}t^2$, where t is in seconds. Work done by the force in 2 seconds is

(a) $\frac{19}{5}$ J (b) $\frac{5}{19}$ J

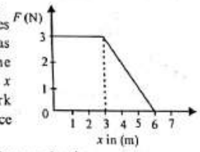
(c) $\frac{3}{8}$ J (d) $\frac{8}{3}$ J. *(2006)*

35. A bomb of mass 30 kg at rest explodes into two pieces of masses 18 kg and 12 kg. The velocity of 18 kg mass is 6 ms^{-1}. The kinetic energy of the other mass is

(a) 324 J (b) 486 J

(c) 256 J (d) 524 J. *(2005)*

36. A force F acting on an object varies with distance x as shown here. The force is in N and x in m. The work done by the force in moving the object from $x = 0$ to $x = 6$ m is



(a) 18.0 J (b) 13.5 J

(c) 9.0 J (d) 4.5 J. *(2005)*

37. A particle of mass m_1 is moving with a velocity v_1 and another particle of mass m_2 is moving with a velocity v_2. Both of them have the same momentum but their different kinetic energies are E_1 and E_2 respectively. If $m_1 > m_2$ then

(a) $E_1 < E_2$ (b) $\frac{E_1}{E_2}=\frac{m_1}{m_2}$

(c) $E_1 > E_2$ (d) $E_1 = E_2$ *(2004)*

38. A ball of mass 2 kg and another of mass 4 kg are dropped together from a 60 feet tall building. After a fall of 30 feet each towards earth, their respective kinetic energies will be in the ratio of

(a) $\sqrt{2}:1$ (b) 1 : 4

(c) 1 : 2 (d) $1:\sqrt{2}$ *(2004)*

39. A mass of 0.5 kg moving with a speed of 1.5 m/s on a horizontal smooth surface, collides with a nearly weightless spring of force constant k = 50 N/m. The maximum compression of the spring would be

(a) 0.15 m (b) 0.12 m

(c) 1.5 m (d) 0.5 m *(2004)*

40. When a long spring is stretched by 2 cm, its potential energy is U. If the spring is stretched by 10 cm, the potential energy stored in it will be
(a) $U/5$ (b) $5U$
(c) $10U$ (d) $25U$ *(2003)*

41. A stationary particle explodes into two particles of masses m_1 and m_2 which move in opposite directions with velocities v_1 and v_2. The ratio of their kinetic energies E_1/E_2 is
(a) m_2/m_1 (b) m_1/m_2
(c) 1 (d) m_1v_2/m_2v_1 *(2003)*

42. If kinetic energy of a body is increased by 300% then percentage change in momentum will be
(a) 100% (b) 150%
(c) 265% (d) 73.2%. *(2002)*

43. A child is sitting on a swing. Its minimum and maximum heights from the ground 0.75 m and 2 m respectively, its maximum speed will be
(a) 10 m/s (b) 5 m/s
(c) 8 m/s (d) 15 m/s. *(2001)*

44. Two springs A and B having spring constant K_A and K_B ($K_A = 2K_B$) are stretched by applying force of equal magnitude. If energy stored in spring A is E_A then energy stored in B will be
(a) $2E_A$ (b) $E_A/4$
(c) $E_A/2$ (d) $4E_A$. *(2001)*

45. A particle is projected making an angle of 45° with horizontal having kinetic energy K. The kinetic energy at highest point will be
(a) $\frac{K}{\sqrt{2}}$ (b) $\frac{K}{2}$
(c) $2K$ (d) K. *(2001, 1997)*

46. If $\vec{F} = (60\hat{i} + 15\hat{j} - 3\hat{k})$ N and $\vec{v} = (2\hat{i} - 4\hat{j} + 5\hat{k})$ m/s, then instantaneous power is
(a) 195 watt (b) 45 watt
(c) 75 watt (d) 100 watt. *(2000)*

47. A mass of 1 kg is thrown up with a velocity of 100 m/s. After 5 seconds, it explodes into two parts. One part of mass 400 g comes down with a velocity 25 m/s. The velocity of other part is (Take $g = 10$ ms^{-2})
(a) 40 m/s ↑ (b) 40 m/s ↓
(c) 100 m/s ↑ (d) 60 m/s ↑. *(2000)*

48. Two bodies with kinetic energies in the ratio of 4 : 1 are moving with equal linear momentum. The ratio of their masses is
(a) 4 : 1 (b) 1 : 1
(c) 1 : 2 (d) 1 : 4. *(199*

49. Two equal masses m_1 and m_2 moving along the same straight line with velocities + 3 m/s and −5 m/s respectively collide elastically. Their velocities after the collision will be respectively
(a) − 4 m/s and +4 m/s
(b) +4 m/s for both
(c) − 3 m/s and +5 m/s
(d) − 5 m/s and + 3 m/s. *(199*

50. A force acts on a 3 g particle in such a way that the position of the particle as a function of time is given by $x = 3t - 4t^2 + t^3$, where x is in metres and t is in seconds. The work done during the first 4 second is
(a) 490 mJ (b) 450 mJ
(c) 576 mJ (d) 530 mJ. *(199*

51. A shell, in flight, explodes into four unequal parts. Which of the following is conserved?
(a) Potential energy (b) Momentum
(c) Kinetic energy (d) Both (a) and (c) *(199*

52. Two bodies of masses m and $4m$ are moving with equal kinetic energies. The ratio of their linear momenta is
(a) 1 : 2 (b) 1 : 4
(c) 4 : 1 (d) 1 : 1. *(1998, 97, 8*

53. A metal ball of mass 2 kg moving with speed of 36 km/h has a head on collision with a stationary ball of mass 3 kg. If after collision, both the balls move as a single mass, then the loss in K.E. due to collision is
(a) 100 J (b) 140 J
(c) 40 J (d) 60 J. *(199*

54. A body moves a distance of 10 m along a straight line under the action of a 5 N force. If the work done is 25 J, then angle between the force and direction of motion of the body is
(a) 60° (b) 75°
(c) 30° (d) 45°. *(199*

55. A moving body of mass m and velocity 3 km/hour collides with a rest body of mass $2m$ and sticks to it. Now the combined mass starts to move. What will be the combined velocity?
(a) 3 km/hour (b) 4 km/hour
(c) 1 km/hour (d) 2 km/hour. *(199*

56. The potential energy between two atoms, in a molecule, is given by $U(x) = \frac{a}{x^{12}} - \frac{b}{x^6}$ where a and b are positive constants and x is the distance between the atoms. The atom is in stable equilibrium, when
(a) $x = \left(\frac{2a}{b}\right)^{1/6}$ (b) $x = \left(\frac{11a}{5b}\right)^{1/6}$
(c) $x = 0$ (d) $x = \left(\frac{a}{2b}\right)^{1/6}$. *(1995)*

57. A body, constrained to move in y-direction, is subjected to a force given by $\vec{F} = (-2\hat{i} + 15\hat{j} + 6\hat{k})$N The work done by this force in moving the body through a distance of $10\hat{j}$ m along y-axis, is
(a) 150 J (b) 20 J
(c) 190 J (d) 160 J. *(1994)*

58. The kinetic energy acquired by a mass m in travelling distance d, starting from rest, under the action of a constant force is directly proportional to
(a) m (b) m^0
(c) $\sqrt{m}$ (d) $1/\sqrt{m}$. *(1994)*

59. A position dependent force, $F = (7 - 2x + 3x^2)$ N acts on a small body of mass 2 kg and displaces it from $x = 0$ to $x = 5$ m. The work done in joule is
(a) 135 (b) 270
(c) 35 (d) 70. *(1994, 92)*

60. When a body moves with a constant speed along a circle
(a) no work is done on it
(b) no acceleration is produced in it
(c) its velocity remains constant
(d) no force acts on it. *(1994)*

61. Two identical balls A and B collide head on elastically. If velocities of A and B, before the collision, are + 0.5 m/s and − 0.3 m/s respectively, then their velocities, after the collision, are respectively
(a) − 0.5 m/s and + 0.3 m/s
(b) + 0.5 m/s and + 0.3 m/s
(c) + 0.3 m/s and − 0.5 m/s
(d) − 0.3 m/s and + 0.5 m/s. *(1994, 91)*

62. Two masses of 1 g and 9 g are moving with equal kinetic energies. The ratio of the magnitudes of their respective linear momenta is
(a) 1 : 9 (b) 9 : 1
(c) 1 : 3 (d) 3 : 1 *(1993)*

63. A particle of mass M is moving in a horizontal circle of radius R with uniform speed v. When it moves from one point to a diametrically opposite point, its
(a) kinetic energy change by $Mv^2/4$
(b) momentum does not change
(c) momentum change by $2Mv$
(d) kinetic energy changes by Mv^2 *(1992)*

64. How much water a pump of 2 kW can raise in one minute to a height of 10 m ? (take $g = 10$ m/s^2)
(a) 1000 litres (b) 1200 litres
(c) 100 litres (d) 2000 litres *(1990)*

65. A bullet of mass 10 g leaves a rifle at an initial velocity of 1000 m/s and strikes the earth at the same level with a velocity of 500 m/s. The work done in joule overcoming the resistance of air will be
(a) 375 (b) 3750
(c) 5000 (d) 500 *(1989)*

66. The coefficient of restitution e for a perfectly elastic collision is
(a) 1 (b) 0
(c) ∞ (d) −1 *(1988)*

EXPLANATIONS

1. **(c):** Let the particles A and B collide at time t. For their collision, the position vectors of both particles should be same at time t, *i.e.*

$$\vec{r}_1 + \vec{v}_1 t = \vec{r}_2 + \vec{v}_2 t$$
$$\vec{r}_1 - \vec{r}_2 = \vec{v}_2 t - \vec{v}_1 t$$
$$= (\vec{v}_2 - \vec{v}_1)t \quad \text{...(i)}$$

Also, $|\vec{r}_1 - \vec{r}_2| = |\vec{v}_2 - \vec{v}_1|t$ or $t = \frac{|\vec{r}_1 - \vec{r}_2|}{|\vec{v}_2 - \vec{v}_1|}$

Substituting this value of t in eqn. (i), we get

$$\vec{r}_1 - \vec{r}_2 = (\vec{v}_2 - \vec{v}_1)\frac{|\vec{r}_1 - \vec{r}_2|}{|\vec{v}_2 - \vec{v}_1|}$$

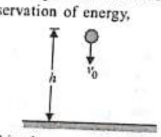
or $\frac{\vec{r}_1 - \vec{r}_2}{|\vec{r}_1 - \vec{r}_2|} = \frac{(\vec{v}_2 - \vec{v}_1)}{|\vec{v}_2 - \vec{v}_1|}$

2. **(c):** Here,
Volume of blood pumped by man's heart,
$V = 5$ litres $= 5 \times 10^{-3}\ \text{m}^3$ $(\because 1 \text{ litre} = 10^{-3}\ \text{m}^3)$
Time in which this volume of blood pumps,
$t = 1$ min $= 60$ s
Pressure at which the blood pumps,
$P = 150$ mm of Hg $= 0.15$ m of Hg
$= (0.15\ \text{m})(13.6 \times 10^3\ \text{kg/m}^3)(10\ \text{m/s}^2)$ $(\because P = h\rho g)$
$= 20.4 \times 10^3\ \text{N/m}^2$

$\therefore$ Power of the heart $= \frac{PV}{t}$

$$= \frac{(20.4 \times 10^3\ \text{N/m}^2)(5 \times 10^{-3}\ \text{m}^3)}{60\ \text{s}} = 1.70\ \text{W}$$

3. **(d):** The situation is shown in the figure.
Let v be the velocity of the ball with which it collides with ground. Then according to the law of conservation of energy,



Gain in kinetic energy = loss in potential energy

i.e. $\frac{1}{2}mv^2 - \frac{1}{2}mv_0^2 = mgh$

(where m is the mass of the ball)

or $v^2 - v_0^2 = 2gh$ ...(i)

Now, when the ball collides with the ground, 50% of its energy is lost and it rebounds to the same height h.

$$\therefore \quad \frac{50}{100}\left(\frac{1}{2}mv^2\right) = mgh$$

$$\frac{1}{4}v^2 = gh \quad \text{or} \quad v^2 = 4gh$$

Substituting this value of v^2 in eqn. (i), we get

$$4gh - v_0^2 = 2gh$$

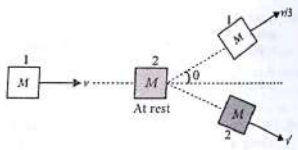
or $v_0^2 = 4gh - 2gh = 2gh$

or $v_0 = \sqrt{2gh}$

Here, $g = 10\ \text{ms}^{-2}$ and $h = 20$ m

$$\therefore \quad v_0 = \sqrt{2(10\ \text{ms}^{-2})(20\text{m})} = 20\ \text{ms}^{-1}$$

4. **(c):** The situation is shown in the figure.



Before collision After collision

Let v' be speed of second block after the collision. As the collision is elastic, so kinetic energy is conserved.
According to conservation of kinetic energy,

$$\frac{1}{2}Mv^2 + 0 = \frac{1}{2}M\left(\frac{v}{3}\right)^2 + \frac{1}{2}Mv'^2$$

$$v^2 = \frac{v^2}{9} + v'^2$$

or $v'^2 = v^2 - \frac{v^2}{9} = \frac{9v^2 - v^2}{9} = \frac{8}{9}v^2$

$$v' = \sqrt{\frac{8}{9}v^2} = \frac{\sqrt{8}}{3}v = \frac{2\sqrt{2}}{3}v$$

5. **(c):** Constant power acting on the particle of mass m is k watt.

or $P = k$

$$\frac{dW}{dt} = k; \quad dW = k\,dt$$

Integrating both sides, $\int_0^W dW = \int_0^t k\,dt$

$\Rightarrow W = kt$ ...(i)

Using work energy theorem, $W = \frac{1}{2}mv^2 - \frac{1}{2}m(0)^2$

$kt = \frac{1}{2}mv^2$ [Using equation (i)]

$$v = \sqrt{\frac{2kt}{m}}$$

Acceleration of the particle, $a = \frac{dv}{dt}$

$$a = \frac{1}{2}\sqrt{\frac{2k}{m}}\frac{1}{\sqrt{t}} = \sqrt{\frac{k}{2mt}}$$

Force on the particle, $F = ma = \sqrt{\frac{mk}{2t}} = \sqrt{\frac{mk}{2}}\,t^{-1/2}$

6. **(c):** Here, $m = 10$ kg, $v_i = 10\ \text{m s}^{-1}$
Initial kinetic energy of the block is

$$K_i = \frac{1}{2}mv_i^2 = \frac{1}{2} \times (10\ \text{kg}) \times (10\ \text{m s}^{-1})^2 = 500\ \text{J}$$

Work done by retarding force

$$W = \int_{x_1}^{x_2} F_r\,dx = \int_{20}^{30} -0.1\,x\,dx = -0.1\left[\frac{x^2}{2}\right]_{20}^{30}$$

$$= -0.1\left[\frac{900 - 400}{2}\right] = -25\ \text{J}$$

According to work-energy theorem,
$W = K_f - K_i$
$K_f = W + K_i = -25\ \text{J} + 500\ \text{J} = 475\ \text{J}$

7. **(a):** Total initial energy of two particles

$$= \frac{1}{2}m_1u_1^2 + \frac{1}{2}m_2u_2^2$$

Total final energy of two particles

$$= \frac{1}{2}m_2v_2^2 + \frac{1}{2}m_1v_1^2 + \varepsilon$$

Using energy conservation principle,

$$\frac{1}{2}m_1u_1^2 + \frac{1}{2}m_2u_2^2 = \frac{1}{2}m_1v_1^2 + \frac{1}{2}m_2v_2^2 + \varepsilon$$

$$\therefore \quad \frac{1}{2}m_1u_1^2 + \frac{1}{2}m_2u_2^2 - \varepsilon = \frac{1}{2}m_1v_1^2 + \frac{1}{2}m_2v_2^2$$

8. **(a)** Here, $K_P > K_Q$
Case (a) : Elongation (x) in each spring is same.

$$W_P = \frac{1}{2}K_Px^2, \quad W_Q = \frac{1}{2}K_Qx^2$$

$\therefore W_P > W_Q$

Case (b) : Force of elongation is same.

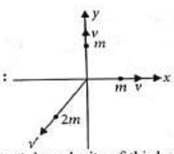
So, $x_1 = \frac{F}{K_P}$ and $x_2 = \frac{F}{K_Q}$

$$W_P = \frac{1}{2}K_Px_1^2 = \frac{1}{2}\frac{F^2}{K_P}$$

$$W_Q = \frac{1}{2}K_Qx_2^2 = \frac{1}{2}\frac{F^2}{K_Q}$$

$\therefore W_P < W_Q$

9. **(b):**



Let $\vec{v}'$ be velocity of third piece of mass $2m$.
Initial momentum, $\vec{p}_i = 0$ (As the body is at rest)

Final momentum, $\vec{p}_f = mv\hat{i} + mv\hat{j} + 2m\vec{v}'$

According to law of conservation of momentum

$$\vec{p}_i = \vec{p}_f$$

$$0 = mv\hat{i} + mv\hat{j} + 2m\vec{v}'$$

$$\vec{v}' = -\frac{v}{2}\hat{i} - \frac{v}{2}\hat{j}$$

The magnitude of v' is

$$v' = \sqrt{\left(-\frac{v}{2}\right)^2 + \left(-\frac{v}{2}\right)^2} = \frac{v}{\sqrt{2}}$$

Total kinetic energy generated due to explosion

$$= \frac{1}{2}mv^2 + \frac{1}{2}mv^2 + \frac{1}{2}(2m)v'^2$$

$$= \frac{1}{2}mv^2 + \frac{1}{2}mv^2 + \frac{1}{2}(2m)\left(\frac{v}{\sqrt{2}}\right)^2$$

$$= mv^2 + \frac{mv^2}{2} = \frac{3}{2}mv^2$$

10. (c) : Here, $\vec{F} = (3\hat{i} + \hat{j})$ N

Initial position, $\vec{r}_1 = (2\hat{i} + \hat{k})$ m

Final position, $\vec{r}_2 = (4\hat{i} + 3\hat{j} - \hat{k})$ m

Displacement, $\vec{r} = \vec{r}_2 - \vec{r}_1$

$\vec{r} = (4\hat{i} + 3\hat{j} - \hat{k})$ m $- (2\hat{i} + \hat{k})$ m $= 2\hat{i} + 3\hat{j} - 2\hat{k}$ m

Work done,

$$W = \vec{F} \cdot \vec{r} = (3\hat{i} + \hat{j}) \cdot (2\hat{i} + 3\hat{j} - 2\hat{k}) = 6 + 3 = 9 \text{ J}$$

11. (c)

12. (d) : Power, $P = \dfrac{\text{Work done}}{\text{Time taken}}$

Here work done ($= mgh$) is same in both cases.

$$\frac{P_1}{P_2} = \frac{t_2}{t_1} = \frac{30 \text{ s}}{1 \text{ min}} = \frac{30 \text{ s}}{60 \text{ s}} = \frac{1}{2}$$

13. (b) : Here, $U = \dfrac{A}{r^2} - \dfrac{B}{r}$

For equilibrium, $\dfrac{dU}{dr} = 0$

$$\therefore -\frac{2A}{r^3} + \frac{B}{r^2} = 0 \text{ or } \frac{2A}{r^3} = \frac{B}{r^2} \text{ or } r = \frac{2A}{B}$$

For stable equilibrium, $\dfrac{d^2U}{dr^2} > 0$

$$\frac{d^2U}{dr^2} = \frac{6A}{r^4} - \frac{2B}{r^3}$$

$$\left.\frac{d^2U}{dr^2}\right|_{r=(2A/B)} = \frac{6AB^4}{16A^4} - \frac{2B^4}{8A^3} = \frac{B^4}{8A^3} > 0$$

So for stable equilibrium, the distance of the particle is $\dfrac{2A}{B}$.

14. (b) : At maximum compression the solid cylinder will stop.

According to law of conservation of mechanical energy

Loss in kinetic energy of cylinder = Gain in potential energy of spring

$$\frac{1}{2}mv^2 + \frac{1}{2}I\omega^2 = \frac{1}{2}kx^2$$

$$\frac{1}{2}mv^2 + \frac{1}{2}\left(\frac{mR^2}{2}\right)\left(\frac{v}{R}\right)^2 = \frac{1}{2}kx^2$$

$\because v = R\omega$ and for solid cylinder, $I = \frac{1}{2}mR^2$

$$\frac{1}{2}mv^2 + \frac{1}{4}mv^2 = \frac{1}{2}kx^2$$

$$\frac{3}{4}mv^2 = \frac{1}{2}kx^2 \text{ or } x^2 = \frac{3}{2}\frac{mv^2}{k}$$

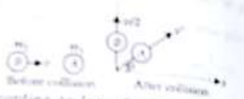
Here, $m = 3$ kg, $v = 4$ m s^{-1}, $k = 200$ N m^{-1}

Substituting the given values, we get

$$x^2 = \frac{3 \times 3 \times 4 \times 4}{2 \times 200}$$

$$x^2 = \frac{36}{100} \text{ or } x = 0.6 \text{ m}$$

15. (d) :



According to law of conservation of linear momentum along x-axis, we get

$m_1 \times 0 + m_2 \times v = m_2 v' \cos\theta$

$m_2 v = m_2 v' \cos\theta$

or $\cos\theta = \dfrac{m_2 v}{m_2 v'}$ ...(i)

According to law of conservation of linear momentum along y-axis, we get

$m_1 v + 0 + m_2 \times 0 = m_2 v' \sin\theta + m_1 \dfrac{v}{2}$

$m_1 \dfrac{v}{2} = m_2 v' \sin\theta$

$\sin\theta = \dfrac{m_1 v}{2m_2 v'}$ ...(ii)

Divide (ii) by (i), we get

$\tan\theta = \dfrac{1}{2}$ [illegible]

or $\theta = \tan^{-1}\left(\dfrac{1}{2}\right)$ to the x-axis

16. (b) : $P_0 = Fv$

$\because F = ma = m\dfrac{dv}{dt}$

$\therefore P_0 = mv\dfrac{dv}{dt}$

or $P_0 dt = mv dv$

Integrating both sides, we get

$$\int_0^t P_0 dt = m\int_0^v v dv$$

$$P_0 t = \frac{mv^2}{2}$$

$$v = \left(\frac{2P_0 t}{m}\right)^{1/2} \text{ or } v \propto \sqrt{t}$$

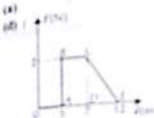
17. (b)

18. (b) : Power, $P = \vec{F} \cdot \vec{v} = Fv\cos\theta$

Just before hitting the earth $\theta = 0°$. Hence, the power exerted by the gravitational force is greatest at the instant just before the body hits the earth.

19. (a)

20. (d) :



Work done = Area under $(F$-$x)$ graph

= Area of rectangle $ABCD$ + Area of triangle DCE

$$= 2 \times (7 - 3) + \frac{1}{2} \times 2 \times (12 - 7) = 8 + 5 = 13 \text{ J}$$

21. (b) :

According to conservation of momentum, we get

$m v\hat{i} + (3m)\frac{2}{3}v\hat{j} = (m + 3m)\vec{v}'$ [illegible]

where $\vec{v}'$ is the final velocity after collision

$$\vec{v}' = \frac{1}{4}v\hat{i} + \frac{2}{4}v\hat{j} = \frac{1}{4}v\hat{i} + \frac{1}{2}v\hat{j}$$

22. (a) : Here, $m_1 = m$, $m_2 = 2m$

$u_1 = 2$ m/s, $u_2 = 0$

Coefficient of restitution, $e = 0.5$

Let v_1 and v_2 be their respective velocities after collision.

Applying the law of conservation of linear momentum, we get

$m_1 u_1 + m_2 u_2 = m_1 v_1 + m_2 v_2$

$\therefore m \times 2 + 2m \times 0 = m \times v_1 + 2m \times v_2$

or $2m = mv_1 + 2mv_2$

or $2 = (v_1 + 2v_2)$ ...(i)

By definition of coefficient of restitution,

$$e = \frac{v_2 - v_1}{u_1 - u_2}$$

or $e(u_1 - u_2) = v_2 - v_1$

$0.5(2 - 0) = v_2 - v_1$

$1 = v_2 - v_1$ ...(ii)

Solving equations (i) and (ii), we get

$v_1 = 0$ m/s, $v_2 = 1$ m/s

23. (d) : Here,

Mass per unit length of water, $\mu = 100$ kg/m

Velocity of water, $v = 2$ m/s

Power of the engine, $P = \mu v^3$

$= (100 \text{ kg/m})(2 \text{ m/s})^3$

$= 800$ W

24. (d) : Power delivered in time T is

$P = FV = MaV$

or $P = MV\dfrac{dV}{dT}$ $\Rightarrow$ $PdT = MVdV$

$\Rightarrow PT = \dfrac{MV^2}{2}$ $\Rightarrow$ $P = \dfrac{1}{2}\dfrac{MV^2}{T}$

25. (a) : When the mass attached to a spring fixed at the other end is allowed to fall suddenly, it extends the spring by x. Potential energy lost by the mass is gained by the spring.

$Mgx = \dfrac{1}{2}kx^2$ $\Rightarrow$ $x = \dfrac{2Mg}{k}$

26. (d) : Initial velocity $u = 20$ m/s, $m = 1$ kg

Kinetic energy = maximum potential energy

Initial kinetic energy $= \dfrac{1}{2} \times 1 \times 20^2 = 200$ J

Mgh (max) $= 200$ J

$h = 20$ m

The height travelled by the body, $h' = 18$ m

$\therefore$ Loss of energy due to air friction $= mgh - mgh'$

$\Rightarrow$ Energy lost $= 200$ J $- 1 \times 10 \times 18$ J $= 20$ J

27. (d) : When an explosion breaks a rock, by the law of conservation of momentum, initial momentum is zero and for the three pieces.

Total momentum of the two pieces 1 kg and 2 kg

$= \sqrt{12^2 + 16^2} = 20$ kg m s^{-1}

The third piece has the same momentum and in the direction opposite to the resultant of these two momenta.

$\therefore$ Momentum of the third piece $= 20$ kg m s^{-1}

Velocity $= 4$ m s^{-1}

$\therefore$ Mass of the 3rd piece $= \dfrac{mv}{v} = \dfrac{20}{4} = 5$ kg

28. (d) : Velocity of water is v, mass flowing per unit length is m.

$\therefore$ Mass flowing per second $= mv$

$\therefore$ Rate of kinetic energy or K.E. per second

$$= \frac{1}{2}(mv)v^2 = \frac{1}{2}mv^3.$$

29. **(c) :** $mv = Mv' \Rightarrow v' = \left(\frac{m}{M}\right)v$

Total K.E. of the bullet and gun

$$= \frac{1}{2}mv^2 + \frac{1}{2}Mv'^2$$

$$\text{Total K.E} = \frac{1}{2}mv^2 + \frac{1}{2}M \cdot \frac{m^2}{M^2}v^2$$

$$\text{Total K.E.} = \frac{1}{2}mv^2\left\{1 + \frac{m}{M}\right\}$$

$$= \left\{\frac{1}{2} \times 0.2\right\}\left\{1 + \frac{0.2}{4}\right\}v^2 = 1.05 \times 1000 \text{ J}$$

$$\Rightarrow v^2 = \frac{4 \times 1.05 \times 1000}{0.1 \times 4.2} = 100^2;$$

$\therefore$ $v = 100 \text{ ms}^{-1}$

30. **(c) :** Mass of water falling/second = 15 kg/s

$h = 60$ m

$g = 10 \text{ m/s}^2$, loss = 10%

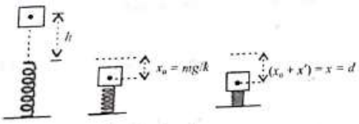
i.e., 90% is used.

Power generated = $15 \times 10 \times 60 \times 0.9$

$= 8100 \text{ W} = 8.1 \text{ kW}.$

31. **(a) :** When a mass falls on a spring from a height h the work done by the loss of potential energy of the mass is stored as the potential energy of the spring.

One can write $mg(h + d) = \frac{1}{2}kd^2$



$$mg(h + d) = \frac{1}{2}kx^2 = \frac{1}{2}kd^2$$

The two energies are equal.

If work done is initial P.E. – final P.E., it is zero. Work done is totally converted (assuming there is no loss). The work done in compression or expansion is always positive as it is $\propto x^2$. The answer expected is

$$mg(h + d) - \frac{1}{2}kd^2 \quad \text{or,} \quad \frac{1}{2}kd^2 - mg(h + d)$$

as seen from options, but it is not justified. Question could have been more specific like work done by oscillation.

32. **(c) :** Loss in potential energy = mgh

$= 2 \times 10 \times 10$

$= 200$ J.

Gain in kinetic energy = work done = 300 J

$\therefore$ Work done against friction = 300 – 200 = 100 J

33. **(d) :** Potential energy of a spring

$= \frac{1}{2} \times$ force constant $\times$ (extension)^2

$\therefore$ Potential energy $\propto$ (extension)^2.

$$\text{or,} \quad \frac{U_1}{U_2} = \left(\frac{x_1}{x_2}\right)^2 \quad \text{or,} \quad \frac{U_1}{U_2} = \left(\frac{2}{8}\right)^2$$

$$\text{or,} \quad \frac{U_1}{U_2} = \frac{1}{16} \quad \text{or,} \quad U_2 = 16U_1 = 16U. \quad (\because U_1 = U)$$

34. **(d) :** $s = \frac{t^2}{3}$; $\frac{ds}{dt} = \frac{2t}{3}$; $\frac{d^2s}{dt^2} = \frac{2}{3}$

$$\text{Work done, } W = \int F ds = \int m\frac{d^2s}{dt^2}ds$$

$$= \int m\frac{d^2s}{dt^2}\frac{ds}{dt}dt = \int_0^2 3 \times \frac{2}{3} \times \frac{2t}{3}dt = \frac{4}{3}\int_0^2 t\,dt$$

$$= \frac{4}{3}\int_0^2 t\,dt = \frac{4}{3}\left|\frac{t^2}{2}\right|_0^2 = \frac{4}{3} \times 2 = \frac{8}{3} \text{ J}.$$

35. **(b) :** According to law of conservation of angular momentum,

$30 \times 0 = 18 \times 6 + 12 \times v$

$\Rightarrow$ $108 = 12v \Rightarrow v = -9$ m/s.

Negative sign indicates that both fragments move in opposite direction.

$$\text{K.E. of 12 kg} = \frac{1}{2}mv^2 = \frac{1}{2} \times 12 \times 81 = 486 \text{ J}.$$

36. **(b) :** Work done = area under F-x curve

$$= \text{area of trapezium} = \frac{1}{2} \times (6 + 3) \times 3 = \frac{9 \times 3}{2}$$

$= 13.5$ J.

37. **(a) :** Kinetic energy = $\frac{p^2}{2m}$

$$\therefore \frac{E_1}{E_2} = \frac{p_1^2/2m_1}{p_2^2/2m_2} \Rightarrow \frac{E_1}{E_2} = \frac{m_2}{m_1} \quad \text{as } m_1 > m_2$$

$\therefore$ $E_1 < E_2$.

38. **(c) :** Ratio of their kinetic energy is given as

$$\frac{KE_1}{KE_2} = \frac{(1/2)\,m_1v_1^2}{(1/2)\,m_2v_2^2}$$

$\Rightarrow$ $v^2 = 2gs$ (zero initial velocity)

which is same for both

$$\therefore \frac{KE_1}{KE_2} = \frac{m_1}{m_2} = \frac{2}{4} = \frac{1}{2}.$$

39. **(a) :** The kinetic energy of mass is converted into energy required to compress a spring which is given by

$$\Rightarrow \frac{1}{2}mv^2 = \frac{1}{2}kx^2$$

$$\Rightarrow x = \sqrt{\frac{mv^2}{k}} = \sqrt{\frac{0.5 \times (1.5)^2}{50}} = 0.15 \text{ m}.$$

40. **(d) :** $U = -kx^2$, k = Spring constant

$$\frac{U_1}{U_2} = \frac{x_1^2}{x_2^2} = \frac{4}{100} \Rightarrow U_2 = 25\,U_1$$

41. **(a) :** $m_1v_1 = m_2v_2$ (conservation of linear momentum)

$$\frac{E_1}{E_2} = \frac{(1/2)m_1v_1^2}{(1/2)m_2v_2^2} = \frac{m_1^2v_1^2}{m_2^2v_2^2} \cdot \frac{m_2}{m_1} = \frac{m_2}{m_1}.$$

42. **(a) :** Let m be the mass of the body and v_1 and v_2 be the initial and final velocities of the body respectively.

$\therefore$ Initial kinetic energy = $\frac{1}{2}mv_1^2$

Final kinetic energy = $\frac{1}{2}mv_2^2$

Initial kinetic energy is increased 300% to get the final kinetic energy.

$$\therefore \frac{1}{2}mv_2^2 = \frac{1}{2}\left(1 + \frac{300}{100}\right)mv_1^2$$

$\Rightarrow$ $v_2 = 2v_1$ or $v_2/v_1 = 2$ ... (i)

Initial momentum = $p_1 = mv_1$

Final momentum = $p_2 = mv_2$

$$\therefore \frac{p_2}{p_1} = \frac{mv_2}{mv_1} = \frac{v_2}{v_1} = 2;$$

$$\therefore p_2 = 2p_1 = \left(1 + \frac{100}{100}\right)p_1$$

So momentum has increased 100%.

43. **(b) :** Drop in P.E = maximum K.E.

$$mg(2 - 0.75) = 1\,mv^2 \Rightarrow v = \sqrt{2g(1.25)} = 5 \text{ m/s}.$$

44. **(a) :** Energy $= \frac{1}{2}Kx^2 = \frac{1}{2}\frac{F^2}{K}$.

$$\frac{K_A}{K_B} = 2$$

$$\therefore \frac{E_A}{E_B} = \frac{1}{2}. \quad \text{or} \quad E_B = 2E_A.$$

45. **(b) :** Kinetic energy of the ball = K and angle of projection $(\theta) = 45°$.

Velocity of the ball at the highest point = $v \cos\theta$

$$= v\cos 45° = \frac{v}{\sqrt{2}}.$$

Therefore kinetic energy of the ball

$$= \frac{1}{2}m \times \left(\frac{v}{\sqrt{2}}\right)^2 = \frac{1}{4}mv^2 = \frac{K}{2}.$$

46. **(b) :** $P = \vec{F} \cdot \vec{v} = (60\hat{i} + 15\hat{j} - 3\hat{k}) \cdot (2\hat{i} - 4\hat{j} + 5\hat{k})$

$= 120 - 60 - 15 = 45$ watts.

47. **(c) :** Velocity after 5 sec, $v = u - gt$

$= 100 - 10 \times 5 = 50$ m/s

By conservation of momentum

$1 \times 50 = 0.4 \times (-25) + 0.6 \times v'$

$60 = 0.6 \times v' \Rightarrow v' = 100$ m/s upwards

48. **(d) :** $\text{K.E.} = \frac{p^2}{2m} \Rightarrow \frac{\text{K.E.}_1}{\text{K.E.}_2} = \frac{m_2}{m_1} = \frac{4}{1}$

or $\frac{m_1}{m_2} = \frac{1}{4}$

49. **(d) :** Equal masses after elastic collision interchange their velocities.

–5 m/s and +3 m/s.

50. **(c) :** $x = 3t - 4t^2 + t^3$ or, $\frac{d^2x}{dt^2} = -8 + 6t$

or $\left.\frac{d^2x}{dt^2}\right|_{t=4} = 16$

or $x|_{t=4} = 12$

Work done = $F \cdot s = mas = 3 \times 10^{-3} \times 16 \times 12$

$= 576$ mJ.

51. **(b)**

52. **(a) :** Mass of first body = m;

Mass of second body = $4m$ and $\text{KE}_1 = \text{KE}_2$.

Linear momentum of a body

$p = \sqrt{2mE} \propto \sqrt{m}$.

$$\text{Therefore} \quad \frac{p_1}{p_2} = \sqrt{\frac{m_1}{m_2}} = \sqrt{\frac{m}{4m}} = \sqrt{\frac{1}{4}} = \frac{1}{2}$$

or $p_1 : p_2 = 1 : 2$.

53. **(d) :** Mass of metal ball = 2 kg;

Speed of metal ball (v_1) = 36 km/h = 10 m/s and mass of stationary ball = 3 kg.

Applying law of conservation of momentum,

$m_1v_1 + m_2v_2 = (m_1 + m_2)v$

$$\text{or,} \quad v = \frac{m_1v_1 + m_2v_2}{m_1 + m_2} = \frac{(2 \times 10) + (3 \times 0)}{2 + 3} = \frac{20}{5}$$

$= 4$ m/s.

Therefore loss of energy

$$= \left[\frac{1}{2}m_1v_1^2 + \frac{1}{2}m_2v_2^2\right] - \frac{1}{2}\times(m_1+m_2)v^2$$

$$= \left[\frac{1}{2}\times 2\times(10)^2 + \frac{1}{2}\times 3(0)^2\right] - \frac{1}{2}\times(2+3)\times(4)^2$$

$= 100 - 40 = 60$ J.

54. **(a) :** Distance $(s) = 10$ m; Force $(F) = 5$ N and work done $(W) = 25$ J.
Work done $(W) = Fs\cos\theta = 25$
$\therefore\ 25 = 5\times 10\cos\theta = 50\cos\theta$
or $\cos\theta = 25/50 = 0.5$ or $\theta = 60°$.

55. **(c) :** Mass of body $(m_1) = m$; Velocity of first body $(u_1) = 3$ km/hour; Mass of second body in rest $(m_2) = 2m$ and velocity of second body $(u_2) = 0$.
After combination, mass of the body
$(M) = m + 2m = 3m$
From the law of conservation of momentum, we get $Mv = m_1u_1 + m_2u_2$
or $3mv = (m\times 3) + (2m\times 0) = 3m$
or $v = 1$ km/hour.

56. **(a) :** $U(x) = \frac{a}{x^{12}} - \frac{b}{x^6}$ or $-\frac{12a}{x^{13}} - \frac{-6b}{x^7} = 0$

or $x^6 = \frac{2a}{b}$. Therefore $x = \left(\frac{2a}{b}\right)^{1/6}$.

57. **(a) :** Force $\vec{F} = (-2\hat{i} + 15\hat{j} + 6\hat{k})$ N and distance $(d) = 10\hat{j}$ m.
Work done
$W = \vec{F}\cdot\vec{d} = (-2\hat{i}+15\hat{j}+6\hat{k})\cdot(10\hat{j}) = 150$ N-m $= 150$ J.

58. **(b) :** $v^2 = u^2 + 2as$ or $v^2 - u^2 = 2as$

or $v^2 - (0)^2 = 2\times\frac{F}{m}\times s$ or $v^2 = \frac{2Fs}{m}$ and

K.E. $= \frac{1}{2}mv^2 = \frac{1}{2}m\times\frac{2Fs}{m} = Fs$.

Thus K.E. is independent of m or directly proportional to m^0.

59. **(a) :** Force $(F) = 7 - 2x + 3x^2$; Mass $(m) = 2$ kg and displacement $(d) = 5$ m. Therefore work done

$$(W) = \int F dx = \int_0^5 (7-2x+3x^2)dx = (7x - x^2 + x^3)_0^5$$

$$= (7\times 5) - (5)^2 + (5)^3 = 35 - 25 + 125 = 135 \text{ J.}$$

60. **(a)**

61. **(d) :** $m_A = m_B$; Velocity of ball A before collision $(u_A) = 0.5$ m/s and velocity of ball $B(u_B) = -0.3$ m/s.
From conservation of momentum,
$m_Au_A + m_Bu_B = m_Av_A + m_Bv_B$ or $(0.5) + (-0.3)$
$= v_1 + v_2$ ...(i)

From energy conservation,

$$\frac{1}{2}m_Au_A^2 + \frac{1}{2}m_Bu_B^2 = \frac{1}{2}m_Av_A^2 + \frac{1}{2}m_Bv_B^2$$

or $(0.5)^2 + (-0.3)^2 = v_1^2 + v_2^2$ ...(ii)
By solving equation (i) and (ii), we get
$v_1 = -0.3$ m/s and $v_2 = +0.5$ m/s.
Alternate method :
In elastic head on collision velocities are interchanged. Therefore u_A now is -0.3 m/s and u_B becomes $+5$ m/s.

62. **(c) :** $\frac{K_1}{K_2} = \frac{p_1^2}{p_2^2}\times\frac{M_2^2}{M_1^2}$

when $K_1 = K_2$

$\frac{p_1}{p_2} = \sqrt{\frac{M_1}{M_2}} = \sqrt{\frac{1}{9}} = \frac{1}{3}$

$\therefore\ p_1 : p_2 = 1 : 3$

63. **(c) :** On the diametrically opposite points, the velocities have same magnitude but opposite directions. Therefore change in momentum is $Mv - (-Mv) = 2Mv$

64. **(b) :** Power $= \frac{\text{work done}}{\text{time taken}} = \frac{W}{t}$

but W = mass × gravity × height

$\therefore\ P = \frac{M\times g\times h}{t}$

$\Rightarrow\ M = \frac{p\times t}{g\times h} = \frac{2000\times 60}{10\times 10} = 1200$ kg.

i.e. 1200 litres as one litre has a mass of 1 kg.

65. **(b) :** Work done = change in kinetic energy of the body

$$W = \frac{1}{2}\times 0.01[(1000)^2 - (500)^2] = 3750 \text{ joule.}$$

66. **(a) :** Coefficient of restitution or resilience of two bodies is defined as the constant ratio of relative velocity after impact to the relative velocity of the bodies before impact when the two bodies collide head on. There velocities are in the opposite directions.

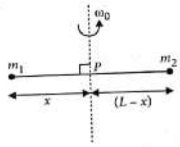
Thus $\frac{v_1 - v_2}{u_1 - u_2}$ = constant $= -e$

The constant e is known as coeff. of restitution or resilience of two bodies. For a perfectly elastic collision, $e = 1$ and for a perfectly inelastic collision $e = 0$. Thus $0 \le e \le 1$.

CHAPTER 6

System of Particles and Rotational Motion

1. Point masses m_1 and m_2 are placed at the opposite ends of a rigid rod of length L, and negligible mass. The rod is to be set rotating about an axis perpendicular to it. The position of point P on this rod through which the axis should pass so that the work required to set the rod rotating with angular velocity ω_0 is minimum, is given by



(a) $x = \frac{m_2}{m_1}L$
(b) $x = \frac{m_2L}{m_1+m_2}$
(c) $x = \frac{m_1L}{m_1+m_2}$
(d) $x = \frac{m_1}{m_2}L$

(AIPMT 2015)

2. An automobile moves on a road with a speed of 54 km h^{-1}. The radius of its wheels is 0.45 m and the moment of inertia of the wheel about its axis of rotation is 3 kg m^2. If the vehicle is brought to rest in 15 s, the magnitude of average torque transmitted by its brakes to the wheel is
(a) 10.86 kg m^2 s^{-2} (b) 2.86 kg m^2 s^{-2}
(c) 6.66 kg m^2 s^{-2} (d) 8.58 kg m^2 s^{-2}

(AIPMT 2015)

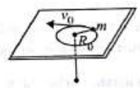
3. A force $\vec{F} = \alpha\hat{i} + 3\hat{j} + 6\hat{k}$ is acting at a point $\vec{r} = 2\hat{i} - 6\hat{j} - 12\hat{k}$. The value of α for which angular momentum about origin is conserved is
(a) zero (b) 1
(c) -1 (d) 2

(AIPMT 2015)

4. A rod of weight W is supported by two parallel knife edges A and B and is in equilibrium in a horizontal position. The knives are at a distance d from each other. The centre of mass of the rod is at distance x from A. The normal reaction on A is
(a) $\frac{W(d-x)}{x}$ (b) $\frac{W(d-x)}{d}$
(c) $\frac{Wx}{d}$ (d) $\frac{Wd}{x}$

(AIPMT 2015, Cancelled)

5. A mass m moves in a circle on a smooth horizontal plane with velocity v_0 at a radius R_0. The mass is attached to a string which passes through a smooth hole in the plane as shown.
The tension in the string is increased gradually and finally m moves in a circle of radius $\frac{R_0}{2}$. The final value of the kinetic energy is



(a) $2mv_0^2$
(b) $\frac{1}{2}mv_0^2$
(c) mv_0^2
(d) $\frac{1}{4}mv_0^2$

(AIPMT 2015, Cancelled)

6. Three identical spherical shells, each of mass m and radius r are placed as shown in figure. Consider an axis XX' which is touching to two shells and passing through diameter of third shell. Moment of inertia of the system consisting of these three spherical shells about XX' axis is

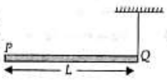
(a) $\frac{16}{5}mr^2$
(b) $4mr^2$
(c) $\frac{11}{5}mr^2$
(d) $3mr^2$

(AIPMT 2015, Cancelled)

7. A solid cylinder of mass 50 kg and radius 0.5 m is free to rotate about the horizontal axis. A massless string is wound round the cylinder with one end attached to it and other hanging freely. Tension in the string required to produce an angular acceleration of 2 revolutions s^{-2} is
(a) 25 N (b) 50 N (c) 78.5 N (d) 157 N
(AIPMT 2014)

8. The ratio of the accelerations for a solid sphere (mass m and radius R) rolling down an incline of angle θ without slipping and slipping down the incline without rolling is
(a) 5 : 7 (b) 2 : 3 (c) 2 : 5 (d) 7 : 5
(AIPMT 2014)

9. A rod PQ of mass M and length L is hinged at end P. The rod is kept horizontal by a massless string tied to point Q as shown in figure. When string is cut, the initial angular acceleration of the rod is



(a) $\frac{2g}{L}$ (b) $\frac{2g}{2L}$ (c) $\frac{3g}{2L}$ (d) $\frac{g}{L}$
(NEET 2013)

10. A small object of uniform density rolls up a curved surface with an initial velocity 'v'. It reaches upto a maximum height of $\frac{3v^2}{4g}$ with respect to the initial position. The object is
(a) hollow sphere (b) disc
(c) ring (d) solid sphere
(NEET 2013)

11. The ratio of radii of gyration of a circular ring and a circular disc, of the same mass and radius, about an axis passing through their centres and perpendicular to their planes are
(a) $1:\sqrt{2}$ (b) 3 : 2
(c) 2 : 1 (d) $\sqrt{2}:1$
(Karnataka NEET 2013)

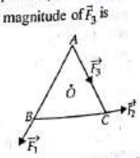
12. Two discs are rotating about their axes, normal to the discs and passing through the centres of the discs. Disc D_1 has 2 kg mass and 0.2 m radius and initial angular velocity of 50 rad s^{-1}. Disc D_2 has 4 kg mass, 0.1 m radius and initial angular velocity of 200 rad s^{-1}. The two discs are brought in contact face to face, with their axes of rotation coincident. The final angular velocity (in rad s^{-1}) of the system is
(a) 60 (b) 100
(c) 120 (d) 40
(Karnataka NEET 2013)

13. When a mass is rotating in a plane about a fixed point, its angular momentum is directed along
(a) a line perpendicular to the plane of rotation
(b) the line making an angle of 45° to the plane of rotation
(c) the radius
(d) the tangent to the orbit *(Prelims 2012)*

14. Two persons of masses 55 kg and 65 kg respectively, are at the opposite ends of a boat. The length of the boat is 3.0 m and weighs 100 kg. The 55 kg man walks up to the 65 kg man and sits with him. If the boat is in still water the center of mass of the system shifts by
(a) 3.0 m (b) 2.3 m
(c) zero (d) 0.75 m
(Prelims 2012)

15. A car of mass 1000 kg negotiates a banked curve of radius 90 m on a frictionless road. If the banking angle is 45°, the speed of the car is
(a) 20 m s^{-1} (b) 30 m s^{-1}
(c) 5 m s^{-1} (d) 10 m s^{-1}
(Prelims 2012)

16. ABC is an equilateral triangle with O as its centre. $\vec{F}_1$, $\vec{F}_2$ and $\vec{F}_3$ represent three forces acting along the sides AB, BC and AC respectively. If the total torque about O is zero then the magnitude of $\vec{F}_3$ is
(a) $F_1 + F_2$
(b) $F_1 - F_2$
(c) $\frac{F_1 + F_2}{2}$
(d) $2(F_1 + F_2)$



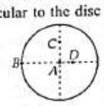
(Prelims 2012, 1998)

17. A car of mass m is moving on a level circular track of radius R. If μ_s represents the static friction between the road and tyres of the car, the maximum speed of the car in circular motion is given by

(a) $\sqrt{\mu_s mRg}$ (b) $\sqrt{\frac{Rg}{\mu_s}}$
(c) $\sqrt{\frac{mRg}{\mu_s}}$ (d) $\sqrt{\mu_s Rg}$ *(Mains 2012)*

18. A circular platform is mounted on a frictionless vertical axle. Its radius $R = 2$ m and its moment of inertia about the axle is 200 kg m^2. It is initially at rest. A 50 kg man stands on the edge of the platform and begins to walk along the edge at the speed of 1 ms^{-1} relative to the ground. Time taken by the man to complete one revolution is
(a) π s (b) $\frac{3\pi}{2}$ s
(c) 2π s (d) $\frac{\pi}{2}$ s *(Mains 2012)*

19. The moment of inertia of a uniform circular disc is maximum about an axis perpendicular to the disc and passing through



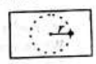
(a) B
(b) C
(c) D
(d) A
(Mains 2012)

20. Three masses are placed on the x-axis : 300 g at origin, 500 g at $x = 40$ cm and 400 g at $x = 70$ cm. The distance of the centre of mass from the origin is
(a) 40 cm (b) 45 cm
(c) 50 cm (d) 30 cm *(Mains 2012)*

21. The instantaneous angular position of a point on a rotating wheel is given by the equation $\theta(t) = 2t^3 - 6t^2$
The torque on the wheel becomes zero at
(a) $t = 1$ s (b) $t = 0.5$ s
(c) $t = 0.25$ s (d) $t = 2$ s
(Prelims 2011)

22. The moment of inertia of a thin uniform rod of mass M and length L about an axis passing through its midpoint and perpendicular to its length is I_0. Its moment of inertia about an axis passing through one of its ends and perpendicular to its length is
(a) $I_0 + ML^2/2$ (b) $I_0 + ML^2/4$
(c) $I_0 + 2ML^2$ (d) $I_0 + ML^2$
(Prelims 2011)

23. A small mass attached to a string rotates on a frictionless table top as shown. If the tension in the string is increased by pulling the string causing the radius of the circular motion to decrease by a factor of 2, the kinetic energy of the mass will



(a) decrease by a factor of 2
(b) remain constant
(c) increase by a factor of 2
(d) increase by a factor of 4 *(Mains 2011)*

24. A circular disk of moment of inertia I_t is rotating in a horizontal plane, about its symmetry axis, with a constant angular speed ω_i. Another disk of moment of inertia I_b is dropped coaxially onto the rotating disk. Initially the second disk has zero angular speed. Eventually both the disks rotate with a constant angular speed ω_f. The energy lost by the initially rotating disc to friction is
(a) $\frac{1}{2}\frac{I_b^2}{(I_t + I_b)}\omega_i^2$ (b) $\frac{1}{2}\frac{I_t^2}{(I_t + I_b)}\omega_i^2$
(c) $\frac{I_b - I_t}{(I_t + I_b)}\omega_i^2$ (d) $\frac{1}{2}\frac{I_b I_t}{(I_t + I_b)}\omega_i^2$
(Prelims 2010)

25. Two particles which are initially at rest, move towards each other under the action of their internal attraction. If their speeds are v and $2v$ at any instant, then the speed of centre of mass of the system will be
(a) $2v$ (b) zero
(c) $1.5v$ (d) v *(Prelims 2010)*

26. A gramophone record is revolving with an angular velocity ω. A coin is placed at a distance r from the centre of the record. The static coefficient of friction is μ. The coin will revolve with the record if
(a) $r = \mu g \omega^2$ (b) $r < \frac{\omega^2}{\mu g}$
(c) $r \le \frac{\mu g}{\omega^2}$ (d) $r \ge \frac{\mu g}{\omega^2}$ *(Prelims 2010)*

27. From a circular disc of radius R and mass $9M$, a small disc of mass M and radius $\frac{R}{3}$ is removed concentrically. The moment of inertia of the remaining disc about an axis perpendicular to the plane of the disc and passing through its centre is
(a) $\frac{40}{9}MR^2$ (b) MR^2
(c) $4MR^2$ (d) $\frac{4}{9}MR^2$ *(Mains 2010)*

28. A solid cylinder and a hollow cylinder, both of the same mass and same external diameter are released from the same height at the same time on an inclined plane. Both roll down without slipping. Which one will reach the bottom first?
(a) Both together only when angle of inclination of plane is 45°
(b) Both together
(c) Hollow cylinder
(d) Solid cylinder *(Mains 2010)*

29. A thin circular ring of mass M and radius r is rotating about its axis with constant angular velocity ω. Two objects each of mass m are attached gently to the opposite ends of a diameter of the ring. The ring now rotates with angular velocity given by
(a) $\frac{(M+2m)\omega}{2m}$ (b) $\frac{2M\omega}{M+2m}$
(c) $\frac{(M+2m)\omega}{M}$ (d) $\frac{M\omega}{M+2m}$
(Mains 2010, 1998)

30. A thin circular ring of mass M and radius R is rotating in a horizontal plane about an axis vertical to its plane with a constant angular velocity ω. If two objects each of mass m be attached gently to the opposite ends of a diameter of the ring, the ring will then rotate with an angular velocity
(a) $\frac{\omega M}{M+2m}$ (b) $\frac{\omega(M+2m)}{M}$
(c) $\frac{\omega M}{M+m}$ (d) $\frac{\omega(M-2m)}{M+2m}$
(Prelims 2009)

31. If $\vec{F}$ is the force acting on a particle having position vector $\vec{r}$ and $\vec{\tau}$ be the torque of this force about the origin, then
(a) $\vec{r}\cdot\vec{\tau}>0$ and $\vec{F}\cdot\vec{\tau}<0$
(b) $\vec{r}\cdot\vec{\tau}=0$ and $\vec{F}\cdot\vec{\tau}=0$
(c) $\vec{r}\cdot\vec{\tau}=0$ and $\vec{F}\cdot\vec{\tau}\neq0$
(d) $\vec{r}\cdot\vec{\tau}\neq0$ and $\vec{F}\cdot\vec{\tau}=0$ *(Prelims 2009)*

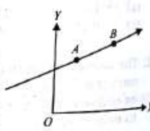
32. Four identical thin rods each of mass M and length l, form a square frame. Moment of inertia of this frame about an axis through the centre of the square and perpendicular to its plane is
(a) $\frac{2}{3}Ml^2$ (b) $\frac{13}{3}Ml^2$
(c) $\frac{1}{3}Ml^2$ (d) $\frac{4}{3}Ml^2$ *(Prelims 2009)*

33. Two bodies of mass 1 kg and 3 kg have position vectors $\hat{i}+2\hat{j}+\hat{k}$ and $-3\hat{i}-2\hat{j}+\hat{k}$, respectively. The centre of mass of this system has a position vector
(a) $-2\hat{i}-\hat{j}+\hat{k}$ (b) $2\hat{i}-\hat{j}-2\hat{k}$
(c) $-\hat{i}+\hat{j}+\hat{k}$ (d) $-2\hat{i}+2\hat{k}$
(Prelims 2009)

34. A thin rod of length L and mass M is bent at its midpoint into two halves so that the angle between them is 90°. The moment of inertia of the bent rod about an axis passing through the bending point and perpendicular to the plane defined by the two halves of the rod is
(a) $\frac{ML^2}{6}$ (b) $\frac{\sqrt{2}ML^2}{24}$
(c) $\frac{ML^2}{24}$ (d) $\frac{ML^2}{12}$ *(Prelims 2008)*

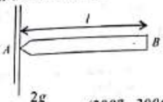
35. The ratio of the radii of gyration of a circular disc to that of a circular ring, each of same mass and radius, around their respective axes is
(a) $\sqrt{2}:1$ (b) $\sqrt{2}:\sqrt{3}$
(c) $\sqrt{3}:\sqrt{2}$ (d) $1:\sqrt{2}$
(Prelims 2008)

36. A particle of mass m moves in the XY plane with a velocity v along the straight line AB. If the angular momentum of the particle with respect to origin O is L_A when it is at A and L_B when it is at B, then



(a) $L_A=L_B$
(b) the relationship between L_A and L_B depends upon the slope of the line AB
(c) $L_A<L_B$
(d) $L_A>L_B$. *(2007)*

37. A uniform rod AB of length l and mass m is free to rotate about point A. The rod is released from rest in the horizontal position. Given that the moment of inertia of the rod about A is $ml^2/3$, the initial angular acceleration of the rod will be



(a) $\frac{mgl}{2}$
(b) $\frac{3}{2}gl$
(c) $\frac{3g}{2l}$ (d) $\frac{2g}{3l}$. *(2007, 2006)*

38. A wheel has angular acceleration of 3.0 rad/sec^2 and an initial angular speed of 2.00 rad/sec. In a time of 2 sec it has rotated through an angle (in radian) of
(a) 10 (b) 12
(c) 4 (d) 6. *(2007)*

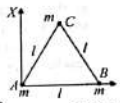
39. The moment of inertia of a uniform circular disc of radius R and mass M about an axis touching the disc at its diameter and normal to the disc
(a) $\frac{1}{2}MR^2$ (b) MR^2
(c) $\frac{2}{5}MR^2$ (d) $\frac{3}{2}MR^2$ *(2006)*

40. The moment of inertia of a uniform circular disc of radius R and mass M about an axis passing from the edge of the disc and normal to the disc is
(a) MR^2 (b) $\frac{1}{2}MR^2$
(c) $\frac{3}{2}MR^2$ (d) $\frac{7}{2}MR^2$. *(2005)*

41. A drum of radius R and mass M, rolls down without slipping along an inclined plane of angle θ. The frictional force
(a) dissipates energy as heat
(b) decreases the rotational motion
(c) decreases the rotational and translational motion
(d) converts translational energy to rotational energy. *(2005)*

42. Two bodies have their moments of inertia I and $2I$ respectively about their axis of rotation. If their kinetic energies of rotation are equal, their angular velocity will be in the ratio
(a) 2 : 1 (b) 1 : 2
(c) $\sqrt{2}:1$ (d) $1:\sqrt{2}$ *(2005)*

43. Three particles, each of mass m gram, are situated at the vertices of an equilateral triangle ABC of side l cm (as shown in the figure). The moment of inertia of the system about a line AX perpendicular to AB and in the plane of ABC, in gram-cm^2 units will be



(a) $\frac{3}{4}ml^2$
(b) $2ml^2$
(c) $\frac{5}{4}ml^2$ (d) $\frac{3}{2}ml^2$ *(2004)*

44. Consider a system of two particles having masses m_1 and m_2. If the particle of mass m_1 is pushed towards the mass centre of particles through a distance d, by what distance would be particle of mass m_2 move so as to keep the mass centre of particles at the original position?
(a) $\frac{m_1}{m_1+m_2}d$ (b) $\frac{m_1}{m_2}d$
(c) d (d) $\frac{m_2}{m_1}d$ *(2004)*

45. A wheel having moment of inertia 2 kg-m^2 about its vertical axis, rotates at the rate of 60 rpm about this axis. The torque which can stop the wheel's rotation in one minute would be
(a) $\frac{2\pi}{15}$ N-m (b) $\frac{\pi}{12}$ N-m
(c) $\frac{\pi}{15}$ N-m (d) $\frac{\pi}{18}$ N-m *(2004)*

46. A round disc of moment of inertia I_2 about its axis perpendicular to its plane and passing through its centre is placed over another disc of moment of inertia I_1 rotating with an angular velocity ω about the same axis. The final angular velocity of the combination of discs is
(a) $\frac{I_2\omega}{I_1+I_2}$ (b) ω
(c) $\frac{I_1\omega}{I_1+I_2}$ (d) $\frac{(I_1+I_2)\omega}{I_1}$
(2004)

47. The ratio of the radii of gyration of a circular disc about a tangential axis in the plane of the disc and of a circular ring of the same radius about a tangential axis in the plane of the ring is
(a) 2 : 3 (b) 2 : 1
(c) $\sqrt{5}:\sqrt{6}$ (d) $1:\sqrt{2}$ *(2004)*

48. A stone is tied to a string of length l and is whirled in a vertical circle with the other end of the string as the centre. At a certain instant of time, the stone is at its lowest position and has a speed u. The magnitude of the change in velocity as it reaches a position where the string is horizontal (g being acceleration due to gravity) is
(a) $\sqrt{2(u^2-gl)}$ (b) $\sqrt{u^2-gl}$
(c) $u-\sqrt{u^2-2gl}$ (d) $\sqrt{2gl}$ *(2003)*

49. A ball rolls without slipping. The radius of gyration of the ball about an axis passing through its centre of mass is K. If radius of the ball be R, then the fraction of total energy associated with its rotational energy will be
(a) $\frac{K^2+R^2}{R^2}$ (b) $\frac{K^2}{R^2}$
(c) $\frac{K^2}{K^2+R^2}$ (d) $\frac{R^2}{K^2+R^2}$ *(2003)*

50. A solid cylinder of mass M and radius R rolls without slipping down an inclined plane of length L and height h. What is the speed of its centre of mass when the cylinder reaches its bottom ?
(a) $\sqrt{2gh}$ (b) $\sqrt{\frac{3}{4}gh}$
(c) $\sqrt{\frac{4}{3}gh}$ (d) $\sqrt{4gh}$
(2003, 1989)

51. A thin circular ring of mass M and radius r is rotating about its axis with a constant angular velocity ω. Four objects each of mass m, are kept gently to the opposite ends of two perpendicular diameters of the ring. The angular velocity of the ring will be
(a) $\frac{M\omega}{4m}$ (b) $\frac{M\omega}{M+4m}$
(c) $\frac{(M+4m)\omega}{M}$ (d) $\frac{(M-4m)\omega}{M+4m}$ *(2003)*

52. A rod of length is 3 m and its mass acting per unit length is directly proportional to distance x from one of its end then its centre of gravity from that end will be at
(a) 1.5 m (b) 2 m
(c) 2.5 m (d) 3.0 m. *(2002)*

53. A point P consider at contact point of a wheel on ground which rolls on ground without slipping then value of displacement of point P when wheel completes half of rotation (If radius of wheel is 1 m)
(a) 2 m (b) $\sqrt{\pi^2+4}$ m
(c) π m (d) $\sqrt{\pi^2+2}$ m. *(2002)*

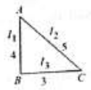
54. A solid sphere of radius R is placed on smooth horizontal surface. A horizontal force F is applied at height h from the lowest point. For the maximum acceleration of centre of mass, which is correct
(a) $h=R$ (b) $h=2R$
(c) $h=0$
(d) no relation between h and R. *(2002)*

55. A disc is rotating with angular speed ω. If a child sits on it, what is conserved
(a) linear momentum
(b) angular momentum
(c) kinetic energy
(d) potential energy. *(2002)*

56. A circular disc is to be made by using iron and aluminium so that it acquired maximum moment of inertia about geometrical axis. It is possible with
(a) aluminium at interior and iron surround to it
(b) iron at interior and aluminium surround to it
(c) using iron and aluminium layers in alternate order
(d) sheet of iron is used at both external surface and aluminium sheet as internal layers. *(2002)*

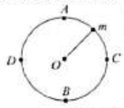
57. A disc is rolling, the velocity of its centre of mass is v_{cm}. Which one will be correct?
(a) the velocity of highest point is $2\,v_{cm}$ and point of contact is zero
(b) the velocity of highest point is v_{cm} and point of contact is v_{cm}
(c) the velocity of highest point is $2v_{cm}$ and point of contact is v_{cm}
(d) the velocity of highest point is $2v_{cm}$ and point of contact is $2v_{cm}$. *(2001)*

58. For the adjoining diagram, the correct relation between I_1, I_2, and I_3 is, (I - moment of inertia)
(a) $I_1 > I_2$
(b) $I_2 > I_1$
(c) $I_3 > I_1$
(d) $I_3 > I_2$. *(2000)*



59. For a hollow cylinder and a solid cylinder rolling without slipping on an inclined plane, then which of these reaches earlier
(a) solid cylinder
(b) hollow cylinder
(c) both simultaneously
(d) can't say anything. *(2000)*

60. As shown in the figure at point O a mass is performing vertical circular motion. The average velocity of the particle is increased, then at which point will the string break
(a) A
(b) B
(c) C
(d) D. *(2000)*



61. Three identical metal balls, each of the radius r are placed touching each other on a horizontal surface such that an equilateral triangle is formed when centres of three balls are joined. The centre of the mass of the system is located at
(a) line joining centres of any two balls
(b) centre of one of the balls
(c) horizontal surface
(d) point of intersection of the medians *(1999)*

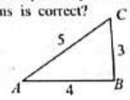
62. The moment of inertia of a disc of mass M and radius R about an axis, which is tangential to the circumference of the disc and parallel to its diameter is
(a) $\frac{5}{4}MR^2$ (b) $\frac{2}{3}MR^2$
(c) $\frac{3}{2}MR^2$ (d) $\frac{4}{5}MR^2$ *(1999)*

63. Find the torque of a force $\vec{F}=-3\hat{i}+\hat{j}+5\hat{k}$ acting at the point $\vec{r}=7\hat{i}+3\hat{j}+\hat{k}$
(a) $-21\hat{i}+4\hat{j}+4\hat{k}$ (b) $-14\hat{i}+34\hat{j}-16\hat{k}$
(c) $14\hat{i}-38\hat{j}+16\hat{k}$ (d) $4\hat{i}+4\hat{j}+6\hat{k}$. *(1997)*

64. The centre of mass of system of particles does not depend on
(a) position of the particles
(b) relative distances between the particles
(c) masses of the particles
(d) forces acting on the particle. *(1997)*

65. A couple produces
(a) linear and rotational motion
(b) no motion
(c) purely linear motion
(d) purely rotational motion. *(1997)*

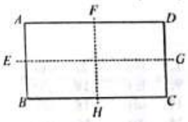
66. The ABC is a triangular plate of uniform thickness. The sides are in the ratio shown in the figure. I_{AB}, I_{BC} and I_{CA} are the moments of inertia of the plate about AB, BC and CA respectively. Which one of the following relations is correct?
(a) $I_{AB}+I_{BC}=I_{CA}$
(b) I_{CA} is maximum
(c) $I_{AB} > I_{BC}$
(d) $I_{BC} > I_{AB}$. *(1995)*



67. What is the torque of the force $\vec{F}=2\hat{i}-3\hat{j}+4\hat{k}$ N acting at the point $\vec{r}=3\hat{i}+2\hat{j}+3\hat{k}$ m about origin?
(a) $-6\hat{i}+6\hat{j}-12\hat{k}$ (b) $-17\hat{i}+6\hat{j}+13\hat{k}$
(c) $6\hat{i}-6\hat{j}+12\hat{k}$ (d) $17\hat{i}-6\hat{j}-13\hat{k}$. *(1995)*

68. A solid spherical ball rolls on a table. Ratio of its rotational kinetic energy to total kinetic energy is
(a) $\frac{1}{2}$ (b) $\frac{1}{6}$ (c) $\frac{7}{10}$ (d) $\frac{2}{7}$. *(1994)*

69. In a rectangle $ABCD$ ($BC=2AB$). The moment of inertia is minimum along axis through
(a) BC
(b) BD
(c) HF (d) EG *(1993)*



70. A solid sphere, disc and solid cylinder all of the same mass and made of the same material are allowed to roll down (from rest) on the inclined plane, then

Scanned by CamScanner

(a) solid sphere reaches the bottom first
(b) solid sphere reaches the bottom last
(c) disc will reach the bottom first
(d) all reach the bottom at the same time *(1993)*

71. The speed of a homogenous solid sphere after rolling down an inclined plane of vertical height h form rest without sliding is
(a) $\sqrt{\frac{10}{7}gh}$ (b) $\sqrt{gh}$
(c) $\sqrt{\frac{6}{5}gh}$ (d) $\sqrt{\frac{4}{3}gh}$ *(1992)*

72. If a sphere is rolling, the ratio of the translational energy to total kinetic energy is given by
(a) 7 : 10 (b) 2 : 5
(c) 10 : 7 (d) 5 : 7 *(1991)*

73. A particle of mass $m = 5$ is moving with a uniform speed $v = 3\sqrt{2}$ in the XOY plane along the line $Y = X + 4$. The magnitude of the angular momentum of the particle about the origin is
(a) 60 units (b) $40\sqrt{2}$ units
(c) zero (d) 7.5 units *(1991)*

74. A fly wheel rotating about fixed axis has a kinetic energy of 360 joule when its angular speed is 30 radian/sec. The moment of inertia of the wheel about the axis of rotation is
(a) 0.6 kgm^2 (b) 0.15 kgm^2
(c) 0.8 kgm^2 (d) 0.75 kgm^2 *(1990)*

75. The moment of inertia of a body about a given axis is 1.2 kgm^2. Initially, the body is at rest. In order to produce a rotational kinetic energy of 1500 joule, an angular acceleration of 25 radian/sec^2 must be applied about that axis for a duration of
(a) 4 s (b) 2 s
(c) 8 s (d) 10 s *(1990)*

76. Moment of inertia of a uniform circular disc about a diameter is I. Its moment of inertia about an axis perpendicular to its plane and passing through a point on its rim will be
(a) $5I$ (b) $3I$
(c) $6I$ (d) $4I$ *(1990)*

77. A solid homogenous sphere of mass M and radius is moving on a rough horizontal surface, partly rolling and partly sliding. During this kind of motion of this sphere
(a) total kinetic energy is conserved
(b) the angular momentum of the sphere about the point of contact with the plane is conserved
(c) only the rotational kinetic energy about the centre of mass is conserved
(d) angular momentum about the centre of mass of conserved *(1988)*

78. A ring of mass m and radius r rotates about an axis passing through its centre and perpendicular to its plane with angular velocity ω. Its kinetic energy is
(a) $\frac{1}{2}mr^2\omega^2$ (b) $mr\omega^2$
(c) $mr^2\omega^2$ (d) $\frac{1}{2}mr\omega^2$ *(1988)*

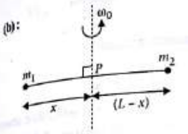
EXPLANATIONS

1. (b):



Moment of inertia of the system about the axis of rotation (through point P) is
$I = m_1x^2 + m_2(L - x)^2$
By work energy theorem,
Work done to set the rod rotating with angular velocity ω_0 = Increase in rotational kinetic energy

$$W = \frac{1}{2}I\omega_0^2 = \frac{1}{2}[m_1x^2 + m_2(L-x)^2]\omega_0^2$$

For W to be minimum, $\frac{dW}{dx} = 0$

i.e. $\frac{1}{2}[2m_1x + 2m_2(L-x)(-1)]\omega_0^2 = 0$

or $m_1x - m_2(L-x) = 0$ $(\because \omega_0 \neq 0)$

or $(m_1 + m_2)x = m_2L$ or $x = \frac{m_2L}{m_1 + m_2}$

2. (c): Here,
Speed of the automobile,

$$v = 54 \text{ km h}^{-1} = 54 \times \frac{5}{18} \text{ m s}^{-1} = 15 \text{ m s}^{-1}$$

Radius of the wheel of the automobile, $R = 0.45$ m
Moment of inertia of the wheel about its axis of rotation, $I = 3$ kg m^2
Time in which the vehicle brought to rest, $t = 15$ s
The initial angular speed of the wheel is

$$\omega_i = \frac{v}{R} = \frac{15 \text{ m s}^{-1}}{0.45 \text{ m}} = \frac{1500}{45} \text{ rad s}^{-1} = \frac{100}{3} \text{ rad s}^{-1}$$

and its final angular speed is
$\omega_f = 0$ (as the vehicle comes to rest)
$\therefore$ The angular retardation of the wheel is

$$\alpha = \frac{\omega_f - \omega_i}{t} = \frac{0 - \frac{100}{3}}{15 \text{ s}} = -\frac{100}{45} \text{ rad s}^{-2}$$

The magnitude of required torque is

$$\tau = I|\alpha| = (3 \text{ kg m}^2)\left(\frac{100}{45} \text{ rad s}^{-2}\right)$$

$$= \frac{20}{3} \text{ kg m}^2\text{s}^{-2} = 6.66 \text{ kg m}^2\text{s}^{-2}$$

3. (c): For the conservation of angular momentum about origin, the torque $\vec{\tau}$ acting on the particle will be zero.
By definition, $\vec{\tau} = \vec{r} \times \vec{F}$

Here, $\vec{r} = 2\hat{i} - 6\hat{j} - 12\hat{k}$ and $\vec{F} = \alpha\hat{i} + 3\hat{j} + 6\hat{k}$

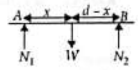
$$\therefore \vec{\tau} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & -6 & -12 \\ \alpha & 3 & 6 \end{vmatrix}$$

$$= \hat{i}(-36 + 36) - \hat{j}(12 + 12\alpha) + \hat{k}(6 + 6\alpha)$$

$$= -\hat{j}(12 + 12\alpha) + \hat{k}(6 + 6\alpha)$$

But $\vec{\tau} = 0$
$\therefore 12 + 12\alpha = 0$ or $\alpha = -1$
and $6 + 6\alpha = 0$ or $\alpha = -1$

4. (b) : Given situation is shown in figure.
N_1 = Normal reaction on A
N_2 = Normal reaction on B
W = Weight of the rod



In vertical equilibrium,
$N_1 + N_2 = W$ ...(i)
Torque balance about centre of mass of the rod,
$N_1x = N_2(d - x)$
Putting value of N_2 from equation (i)
$N_1x = (W - N_1)(d - x)$
$\Rightarrow N_1x = Wd - Wx - N_1d + N_1x$
$\Rightarrow N_1d = W(d - x)$
$\therefore N_1 = \frac{W(d-x)}{d}$

5. (a) : According to law of conservation of angular momentum
$mvr = mv'r'$
$v_0R_0 = v\left(\frac{R_0}{2}\right)$; $v = 2v_0$ ...(i)

$$\therefore \frac{K_0}{K} = \frac{\frac{1}{2}mv_0^2}{\frac{1}{2}mv^2} = \left(\frac{v_0}{v}\right)^2$$

Scanned by CamScanner

or $\dfrac{K}{K_0}=\left(\dfrac{v}{v_0}\right)^2=(2)^2$ (Using (i))

$K=4K_0=2mv_0^2$

6. (b) : Net moment of inertia of the system,

$I=I_1+I_2+I_3$

The moment of inertia of a shell about its diameter,

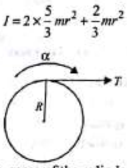
$I_1=\dfrac{2}{3}mr^2$

The moment of inertia of a shell about its tangent is given by

$I_2=I_3=I_1+mr^2=\dfrac{2}{3}mr^2+mr^2=\dfrac{5}{3}mr^2$

$\therefore\ I=2\times\dfrac{5}{3}mr^2+\dfrac{2}{3}mr^2=\dfrac{12mr^2}{3}=4mr^2$

7. (d) :



Here, mass of the cylinder, $M=50$ kg
Radius of the cylinder, $R=0.5$ m
Angular acceleration, $\alpha=2$ rev s^{-2}
$=2\times2\pi$ rad $s^{-2}=4\pi$ rad s^{-2}
Torque, $\tau=TR$
Moment of inertia of the solid cylinder about its axis, $I=\dfrac{1}{2}MR^2$

$\therefore$ Angular acceleration of the cylinder

$\alpha=\dfrac{\tau}{I}=\dfrac{TR}{\frac{1}{2}MR^2}$

$T=\dfrac{MR\alpha}{2}=\dfrac{50\times0.5\times4\pi}{2}=157$ N

8. (a) : Acceleration of the solid sphere slipping down the incline without rolling is

$a_{slipping}=g\sin\theta$ ... (i)

Acceleration of the solid sphere rolling down the incline without slipping is

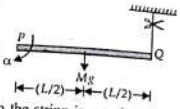
$a_{rolling}=\dfrac{g\sin\theta}{1+\frac{k^2}{R^2}}=\dfrac{g\sin\theta}{1+\frac{2}{5}}$ $\left(\because \text{For solid sphere, } \dfrac{k^2}{R^2}=\dfrac{2}{5}\right)$

$=\dfrac{5}{7}g\sin\theta$ ... (ii)

Divide eqn. (ii) by eqn. (i), we get

$\dfrac{a_{rolling}}{a_{slipping}}=\dfrac{5}{7}$

9. (c) :



When the string is cut, the rod will rotate about P. Let α be initial angular acceleration of the rod. Then

Torque, $\tau=I\alpha=\dfrac{ML^2}{3}\alpha$ ...(i)

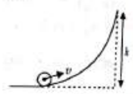
(Moment of inertia of the rod about one end $=\dfrac{ML^2}{3}$)

Also, $\tau=Mg\dfrac{L}{2}$ ...(ii)

Equating (i) and (ii), we get

$Mg\dfrac{L}{2}=\dfrac{ML^2}{3}\alpha$ or $\alpha=\dfrac{3g}{2L}$

10. (b) : The kinetic energy of the rolling object is converted into potential energy at height



$h\left(=\dfrac{3v^2}{4g}\right)$

So by the law of conservation of mechanical energy, we have

$\dfrac{1}{2}Mv^2+\dfrac{1}{2}I\omega^2=Mgh$ $\left(\because\omega=\dfrac{v}{R}\right)$

$\dfrac{1}{2}Mv^2+\dfrac{1}{2}I\left(\dfrac{v}{R}\right)^2=Mg\left(\dfrac{3v^2}{4g}\right)$

$\dfrac{1}{2}I\dfrac{v^2}{R^2}=\dfrac{3}{4}Mv^2-\dfrac{1}{2}Mv^2$

$\dfrac{1}{2}I\dfrac{v^2}{R^2}=\dfrac{1}{4}Mv^2$ or $I=\dfrac{1}{2}MR^2$

Hence, the object is disc.

11. (d) : Let M and R be mass and radius of the ring and the disc respectively. Then,
Moment of inertia of ring about an axis passing

through its centre and perpendicular to its plane is

$I_{ring}=MR^2$

Moment of inertia of disc about the same axis is

$I_{disc}=\dfrac{MR^2}{2}$

As $I=Mk^2$ where k is the radius of gyration

$\therefore\ I_{ring}=Mk^2_{ring}=MR^2$

or $k_{ring}=R$

and $I_{disc}=Mk^2_{disc}=\dfrac{MR^2}{2}$

or $k_{disc}=\dfrac{R}{\sqrt{2}}$

$\therefore\ \dfrac{k_{ring}}{k_{disc}}=\dfrac{R}{R/\sqrt{2}}=\dfrac{\sqrt{2}}{1}$

$k_{ring}:k_{disc}=\sqrt{2}:1$

12. (b) : Moment of inertia of disc D_1 about an axis passing through its centre and normal to its plane is

$I_1=\dfrac{MR^2}{2}=\dfrac{(2\text{ kg})(0.2\text{ m})^2}{2}=0.04\text{ kg m}^2$.

Initial angular velocity of disc D_1, $\omega_1=50$ rad s^{-1}
Moment of inertia of disc D_2 about an axis passing through its centre and normal to its plane is

$I_2=\dfrac{(4\text{ kg})(0.1\text{ m})^2}{2}=0.02\text{ kg m}^2$

Initial angular velocity of disc D_2, $\omega_2=200$ rad s^{-1}
Total initial angular momentum of the two discs is

$L_i=I_1\omega_1+I_2\omega_2$

When two discs are brought in contact face to face (one on the top of the other) and their axes of rotation coincident, the moment of inertia I of the system is equal to the sum of their individual moment of inertia.

$I=I_1+I_2$

Let ω be the final angular speed of the system. The final angular momentum of the system is

$L_f=I\omega=(I_1+I_2)\omega$

According to law of conservation of angular momentum, we get

$L_i=L_f$

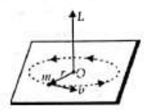
$I_1\omega_1+I_2\omega_2=(I_1+I_2)\omega$

$\omega=\dfrac{I_1\omega_1+I_2\omega_2}{I_1+I_2}$

$=\dfrac{(0.04\text{ kg m}^2)(50\text{ rad s}^{-1})+(0.02\text{ kg m}^2)(200\text{ rad s}^{-1})}{(0.04+0.02)\text{ kg m}^2}$

$=\dfrac{(2+4)}{0.06}$ rad $s^{-1}=100$ rad s^{-1}

13. (a) : When a mass is rotating in a plane about a fixed point its angular momentum is directed along a line perpendicular to the plane of rotation.



14. (c) : As no external force acts on the system, therefore centre of mass will not shift.

15. (b) : Here, $m=1000$ kg, $R=90$ m, $\theta=45°$

For banking, $\tan\theta=\dfrac{v^2}{Rg}$

or $v=\sqrt{Rg\tan\theta}=\sqrt{90\times10\times\tan45°}=30\text{ m s}^{-1}$

16. (a) : Let x be the distance of centre O of equilateral triangle from each side.

Total torque about $O=0$

$\Rightarrow F_1x+F_2x-F_3x=0$ or $F_3=F_1+F_2$

17. (d) : Force of friction provides the necessary centripetal force.

$f\le\mu_sN=\dfrac{mv^2}{R}$

$v^2\le\dfrac{\mu_sRN}{m}$

$v^2\le\mu_sRg$ $[\because N=mg]$

or $v\le\sqrt{\mu_sRg}$

$\therefore$ The maximum speed of the car in circular motion is

$v_{max}=\sqrt{\mu_sRg}$

18. (c) : As the system is initially at rest, therefore, initial angular momentum $L_i=0$.
According to the principle of conservation of angular momentum, final angular momentum, $L_f=0$.
$\therefore$ Angular momentum = Angular momentum of man is in opposite direction of platform.
i.e., $mvR=I\omega$

or $\omega = \frac{mvR}{I} = \frac{50 \times 1 \times 2}{200} = \frac{1}{2}\text{ rad s}^{-1}$

Angular velocity of man relative to platform is

$$\omega_r = \omega + \frac{v}{R} = \frac{1}{2} + \frac{1}{2} = 1\text{ rad s}^{-1}$$

Time taken by the man to complete one revolution is

$$T = \frac{2\pi}{\omega_r} = \frac{2\pi}{1} = 2\pi\text{ s}$$

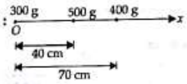
19. **(a)** : According to the theorem of parallel axes,

$I = I_{CM} + Ma^2$

As a is maximum for point B.

Therefore I is maximum about B.

20. **(a)** :



The distance of the centre of mass of the system of three masses from the origin O is

$$X_{CM} = \frac{m_1x_1 + m_2x_2 + m_3x_3}{m_1 + m_2 + m_3}$$

$$= \frac{300 \times 0 + 500 \times 40 + 400 \times 70}{300 + 500 + 400}$$

$$= \frac{500 \times 40 + 400 \times 70}{1200} = \frac{400\,[50 + 70]}{1200}$$

$$= \frac{50 + 70}{3} = \frac{120}{3} = 40\text{ cm}$$

21. **(a)** : Given : $\theta(t) = 2t^3 - 6t^2$

$\therefore \frac{d\theta}{dt} = 6t^2 - 12t$

$\frac{d^2\theta}{dt^2} = 12t - 12$

Angular acceleration, $\alpha = \frac{d^2\theta}{dt^2} = 12t - 12$

When angular acceleration (α) is zero, then the torque on the wheel becomes zero ($\because \tau = I\alpha$)

$\Rightarrow 12t - 12 = 0$ or $t = 1$ s

22. **(b)** : According to the theorem of parallel axes, the moment of inertia of the thin rod of mass M and length L about an axis passing through one of the ends is

$$I = I_{CM} + Md^2$$

where I_{CM} is the moment of inertia of the given rod about an axis passing through its centre of mass and perpendicular to its length and d is the distance between two parallel axes.

Here, $I_{CM} = I_0$, $d = \frac{L}{2}$

$\therefore I = I_0 + M\left(\frac{L}{2}\right)^2 = I_0 + \frac{ML^2}{4}$

23. **(d)** : According to law of conservation of angular momentum

$mvr = mv'r'$

$vr = v'\left(\frac{r}{2}\right)$

$v' = 2v$ ...(i)

$\therefore \frac{K}{K'} = \frac{\frac{1}{2}mv^2}{\frac{1}{2}mv'^2} = \left(\frac{v}{v'}\right)^2$

or $\frac{K'}{K} = \left(\frac{v'}{v}\right)^2 = (2)^2$ (Using (i))

$K' = 4K$

24. **(d)** : As no external torque is applied to the system, the angular momentum of the system remains conserved.

$\therefore L_i = L_f$

According to given problem,

$I_t\omega_i = (I_t + I_b)\omega_f$

or $\omega_f = \frac{I_t\omega_i}{(I_t + I_b)}$ ...(i)

Initial energy, $E_i = \frac{1}{2}I_t\omega_i^2$ ...(ii)

Final energy, $E_f = \frac{1}{2}(I_t + I_b)\omega_f^2$ ...(iii)

Substituting the value of ω_f from equation (i) in equation (iii), we get

Final energy, $E_f = \frac{1}{2}(I_t + I_b)\left(\frac{I_t\omega_i}{I_t + I_b}\right)^2$

$= \frac{1}{2}\frac{I_t^2\omega_i^2}{(I_t + I_b)}$ ...(iv)

Loss of energy, $\Delta E = E_i - E_f$

$= \frac{1}{2}I_t\omega_i^2 - \frac{1}{2}\frac{I_t^2\omega_i^2}{(I_t + I_b)}$ (Using (ii) and (iv))

$= \frac{\omega_i^2}{2}\left(I_t - \frac{I_t^2}{(I_t + I_b)}\right) = \frac{\omega_i^2}{2}\left(\frac{I_t^2 + I_bI_t - I_t^2}{(I_t + I_b)}\right)$

$= \frac{1}{2}\frac{I_bI_t}{(I_t + I_b)}\omega_i^2$

25. **(b)** : As no external force is acting on the system, the centre of mass must be at rest *i.e.* $v_{CM} = 0$.

26. **(c)** : The coin will revolve with the record, if

Force of friction $\geq$ Centrifugal force

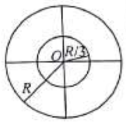
$\mu mg \geq mr\omega^2$

or $r \leq \frac{\mu g}{\omega^2}$

27. **(a)** : Mass of the disc = $9M$

Mass of removed portion of disc = M

The moment of inertia of the complete disc about an axis passing through its centre O and perpendicular to its plane is



$I_1 = \frac{9}{2}MR^2$

Now, the moment of inertia of the disc with removed portion

$I_2 = \frac{1}{2}M\left(\frac{R}{3}\right)^2 = \frac{1}{18}MR^2$

Therefore, moment of inertia of the remaining portion of disc about O is

$$I = I_1 - I_2 = 9\frac{MR^2}{2} - \frac{MR^2}{18} = \frac{40MR^2}{9}$$

28. **(d)** : Time taken to reach the bottom of inclined plane.

$$t = \sqrt{\frac{2l\left(1 + \frac{K^2}{R^2}\right)}{g\sin\theta}}$$

Here, l is length of incline plane

For solid cylinder $K^2 = \frac{R^2}{2}$

For hollow cylinder $K^2 = R^2$

Hence, solid cylinder will reach the bottom first.

29. **(d)** : As no external torque is acting about the axis, angular momentum of system remains conserved.

$I_1\omega_1 = I_2\omega_2$

$\Rightarrow \omega_2 = \frac{I_1\omega_1}{I_2} = \frac{Mr^2\omega}{(M + 2m)r^2} = \frac{M\omega}{(M + 2m)}$

30. **(a)** : As the masses are added to the ring gently, there is no torque and angular momentum is conserved.

$I\omega = I'\omega'$

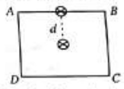
$\Rightarrow MR^2\omega = (MR^2 + 2mR^2)\omega'$

$\Rightarrow \omega' = \frac{MR^2\omega}{(M + 2m)R^2} \Rightarrow \omega' = \frac{M\omega}{M + 2m}$.

31. **(b)** : Torque is always perpendicular to $\vec{F}$ as well as $\vec{r}$.

$\therefore \vec{r}\cdot\vec{\tau} = 0$ as well as $\vec{F}\cdot\vec{\tau} = 0$.

32. **(d)** : Moment of inertia for the rod AB rotating about an axis through the mid-point of AB perpendicular to the plane of the paper is $\frac{Ml^2}{12}$.



$\therefore$ Moment of inertia about the axis through the centre of the square and parallel to this axis,

$$I = I_0 + Md^2 = M\left(\frac{l^2}{12} + \frac{l^2}{4}\right) = \frac{Ml^2}{3}.$$

For all the four rods, $I = \frac{4}{3}Ml^2$.

33. **(a)** : $\vec{r}_1 = \hat{i} + 2\hat{j} + \hat{k}$ for $M_1 = 1$ kg

$\vec{r}_2 = -3\hat{i} - 2\hat{j} + \hat{k}$ for $M_2 = 3$ kg

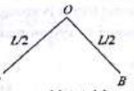
$r_{C.M.} = \frac{\sum m_i r_i}{\sum m_i}$

$\Rightarrow r_{C.M.} = \frac{(1\hat{i} + 2\hat{j} + 1\hat{k})\times 1 + (-3\hat{i} - 2\hat{j} + \hat{k})\times 3}{4}$

$\Rightarrow r_{C.M.} = \frac{(1\hat{i} + 2\hat{j} + 1\hat{k})\times 1 + (-9\hat{i} - 6\hat{j} + 3\hat{k})}{4}$

$\Rightarrow r_{C.M.} = \frac{-8\hat{i} - 4\hat{j} + 4\hat{k}}{4} = -2\hat{i} - \hat{j} + \hat{k}$.

34. (d):



Total mass $= M$, total length $= L$
Moment of inertia of OA about O = Moment of inertia of OB about O.

$$\Rightarrow \text{M.I. total} = 2\times\left(\frac{M}{2}\right)\left(\frac{L}{2}\right)^2\cdot\frac{1}{3} = \frac{ML^2}{12}$$

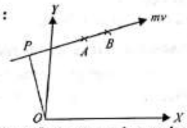
35. (d) : M.I. of a circular disc, $Mk^2 = \frac{M\cdot R^2}{2}$

M.I. of a circular ring $= MR^2$.

$\therefore$ Ratio of their radius of gyration

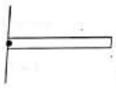
$$= \frac{1}{\sqrt{2}}:1 \text{ or } 1:\sqrt{2}$$

36. (a) :



Moment of momentum is angular momentum. OP is the same whether the mass is at A or B.
$\therefore\ L_A = L_B$.

37. (c) : Torque about A,



$$\tau = mg\times\frac{l}{2} = \frac{mgl}{2}$$

Also $\tau = I\alpha$

$\therefore$ Angular acceleration,

$$\alpha = \frac{\tau}{I} = \frac{mgl/2}{ml^2/3} = \frac{3}{2}\frac{g}{l}.$$

38. (a) : Given: Angular acceleration, $\alpha = 3$ rad/sec^2
Initial angular velocity $\omega_i = 2$ rad/sec
Time $t = 2$ sec

Using, $\theta = \omega_i t + \frac{1}{2}\alpha t^2$

$\therefore\ \theta = 2\times 2 + \frac{1}{2}\times 3\times 4 = 4 + 6 = 10$ radian.

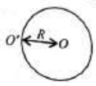
39. (d) : Moment of inertia of a uniform circular disc about an axis through its centre and perpendicular to its plane is $I_C = \frac{1}{2}MR^2$.

By the theorem of parallel axes,

$\therefore$ Moment of inertia of a uniform circular disc about an axis touching the disc at its diameter and normal to the disc is I.

$$I = I_C + Mh^2 = \frac{1}{2}MR^2 + MR^2 = \frac{3}{2}MR^2.$$

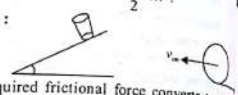
40. (c) : M.I. of disc about its normal $= \frac{1}{2}MR^2$



M.I. about its one edge $= MR^2 + \frac{MR^2}{2}$
(Perpendicular to the plane)

Moment of inertia $= \frac{3}{2}MR^2$.

41. (d) :



Required frictional force converts translational energy into rotational energy.

42. (c) : $K.E. = \frac{1}{2}I\omega^2$

$$\therefore\ \frac{1}{2}I_1\omega_1^2 = \frac{1}{2}\cdot 2I_1\omega_2^2$$

$$\frac{\omega_1^2}{\omega_2^2} = \frac{2}{1} \Rightarrow \frac{\omega_1}{\omega_2} = \frac{\sqrt{2}}{1}.$$

43. (c) : The moment of inertia of the system $= m_Ar_A^2 + m_Br_B^2 + m_Cr_C^2$
$= m_A(0)^2 + m(l)^2 + m(l\sin 30°)^2$
$= ml^2 + ml^2\times(1/4) = (5/4)\,ml^2$

44. (b) : $C.M. = \frac{m_1x_1 + m_2x_2}{m_1 + m_2}$

After changing position of m_1 and to keep position of $C.M.$ same

$$C.M. = \frac{m_1(x_1 - d) + m_2(x_2 + d_2)}{m_1 + m_2}$$

$$0 = \frac{m_1d + m_2d_2}{m_1 + m_2}$$

[Substituting value of C.M. for

$$\Rightarrow d_2 = \frac{m_1}{m_2}d$$

45. (c) : $\omega_f = \omega_i - \alpha t \Rightarrow 0 = \omega_i - \alpha t$
$\therefore\ \alpha = \omega_i/t$, where α is retardation.
The torque on the wheel is given by

$$\tau = I\alpha = \frac{I\omega}{t} = \frac{I\cdot 2\pi\upsilon}{t} = \frac{2\times 2\times\pi\times 60}{60\times 60}$$

$\tau = \frac{\pi}{15}$ N-m

This is the torque required to stop the wheel in 1 min. (or 60 sec.).

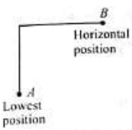
46. (c) : Applying conservation of angular momentum.
$I_1\omega = (I_1 + I_2)\omega_1$

$$\omega_1 = \frac{I_1}{(I_1 + I_2)}\omega$$

47. (c) : Radius of gyration of disc about a tangential axis in the plane of disc is $\frac{\sqrt{5}}{2}R = K_1$, radius of gyration of circular ring of same radius about a tangential axis in the plane of circular ring is

$$K_2 = \sqrt{\frac{3}{2}}R \ \therefore\ \frac{K_1}{K_2} = \frac{\sqrt{5}}{\sqrt{6}}.$$

48. (a) : The total energy at A = the total energy at B



$$\Rightarrow \frac{1}{2}mu^2 = \frac{1}{2}mv^2 + mgl$$

$$\Rightarrow v = \sqrt{u^2 - 2gl}$$

The change in magnitude of velocity $= \sqrt{u^2 + v^2}$

$$= \sqrt{2(u^2 - gl)}$$

49. (c) : Total energy

$$= \frac{1}{2}I\omega^2 + \frac{1}{2}mv^2 = \frac{1}{2}mv^2(1 + K^2/R^2)$$

Required fraction $= \frac{K^2/R^2}{1 + K^2/R^2} = \frac{K^2}{R^2 + K^2}$.

50. (c) : Potential energy of the solid cylinder at height $h = Mgh$

K.E. of centre of mass when reached at bottom

$$= \frac{1}{2}Mv^2 + \frac{1}{2}I\omega^2 = \frac{1}{2}Mv^2 + \frac{1}{2}Mk^2v^2/R^2$$

$$= \frac{1}{2}Mv^2\left(1 + \frac{k^2}{R^2}\right)$$

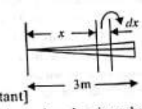
For a solid cylinder $\frac{k^2}{R^2} = \frac{1}{2}$ $\quad\therefore$ K.E. $= \frac{3}{4}Mv^2$

$\therefore\ Mgh = \frac{3}{4}Mv^2 \qquad v = \sqrt{\frac{4}{3}gh}.$

51. (b) : According to conservation of angular momentum, $L = I\omega$ = constant.
Therefore, $I_2\omega_2 = I_1\omega_1$

$$\text{or } \omega_2 = \frac{I_1\omega_1}{I_2} = \frac{Mk^2\omega}{(M + 4m)k^2} = \frac{M\omega}{M + 4m}.$$

52. (b) : Let us consider an elementary length dx at a distance x from one end.
It's mass $= k\cdot x\cdot dx$
[k = proportionality constant]



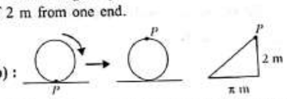
Then centre of gravity of the rod x_c is given by

$$x_c = \frac{\int_0^3 kx\,dx\cdot x}{\int_0^3 kx\,dx} = \frac{\int_0^3 x^2\,dx}{\int_0^3 x\,dx} = \frac{\left.\frac{x^3}{3}\right|_0^3}{\left.\frac{x^2}{2}\right|_0^3}$$

or, $x_c = \frac{27/3}{9/2} = 2.$

$\therefore$ Centre of gravity of the rod will be at distance of 2 m from one end.

53. (b) :



In half rotation point P has moved horizontally.
$\frac{\pi d}{2} = \pi r = \pi\times 1\text{ m} = \pi\text{ m}$. [$\because$ radius = 1 m]
In the same time, it has moved vertically a distance which is equal to its diameter = 2 m.
$\therefore$ Displacement of $P = \sqrt{\pi^2 + 2^2} = \sqrt{\pi^2 + 4}$ m.

54. (d) : Since there is no friction at the contact surface (smooth horizontal surface) there will be no rolling. Hence, the acceleration of the centre of mass of the sphere will be independent of the position of the applied force F. Therefore, there is no relation between h and R.

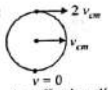
55. (b) : When a child sits on a rotating disc, no external torque is introduced. Hence the angular momentum of the system is conserved. But the moment of inertia of the system will increase and as a result, the angular speed of the disc will decrease to maintain constant angular momentum.
[$\because$ angular momentum = moment of inertia × angular velocity]

56. (a) : A circular disc may be divided into a large number of circular rings. Moment of inertia of the disc will be the summation of the moments of inertia of these rings about the geometrical axis.

Now, moment of inertia of a circular ring about its geometrical axis is MR^2, where M is the mass and R is the radius of the ring.

Since the density (mass per unit volume) for iron is more than that of aluminium, the proposed rings made of iron should be placed at a higher radius to get more value of MR^2. Hence to get maximum moment of inertia for the circular disc, aluminium should be placed at interior and iron at the outside.

57. (a) :



58. (b) : As effective distance of mass from BC is greater than the effective distance of mass from AB, therefore $I_2 > I_1$.

59. (a) : Solid sphere reaches the bottom first because

for solid cylinder $\frac{K^2}{R^2} = \frac{1}{2}$,

and for hollow cylinder $\frac{K^2}{R^2} = 1$.

Acceleration down the inclined plane $\propto \frac{1}{K^2/R^2}$.

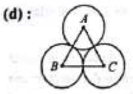
Solid cylinder has greater acceleration, so it reaches the bottom first.

60. (b) : When a sphere is rotating in a vertical circle, it exerts the maximum outward pull when it is at the lowest point B.

Therefore, tension at B is maximum = Weight+ $\frac{mv^2}{R}$

So, the string breaks at point B.

61. (d) :



Centre of mass of each ball lies on the centre.

$\Rightarrow$ Centre of mass of combined body will be at the centroid of equilateral triangle.

62. (a) : Moment of inertia of a disc about its diameter

$= \frac{1}{4}MR^2$

Using theorem of parallel axes,

$$I = \frac{1}{4}MR^2 + MR^2 = \frac{5}{4}MR^2.$$

63. (c) : Force $(\vec{F}) = -3\hat{i} + \hat{j} + 5\hat{k}$ and distance of the point $(\vec{r}) = 7\hat{i} + 3\hat{j} + \hat{k}$.

Torque $\vec{\tau} = \vec{r} \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 7 & 3 & 1 \\ -3 & 1 & 5 \end{vmatrix} = 14\hat{i} - 38\hat{j} + 16\hat{k}$

64. (d) : The resultant of all forces, on any system of particles, is zero. Therefore their centre of mass does not depend upon the forces acting on the particles.

65. (d)

66. (d) : The intersection of medians is the centre of mass of the triangle. Since the distances of centre of mass from the sides is related as $x_{BC} < x_{AB} < x_{AC}$. Therefore $I_{BC} > I_{AB} > I_{AC}$ or $I_{BC} > I_{AB}$.

67. (d) : Force $(\vec{F}) = 2\hat{i} - 3\hat{j} + 4\hat{k}$ N and distance of the point from origin $(r) = 3\hat{i} + 2\hat{j} + 3\hat{k}$ m.

Torque $\vec{\tau} = \vec{r} \times \vec{F} =$

$$(3\hat{i} + 2\hat{j} + 3\hat{k}) \times (2\hat{i} - 3\hat{j} + 4\hat{k}) = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & 2 & 3 \\ 2 & -3 & 4 \end{vmatrix}$$

$$= 17\hat{i} - 6\hat{j} - 13\hat{k}$$

68. (d) : Linear K.E. of ball $= \frac{1}{2}mv^2$ and rotational K.E of ball $= \frac{1}{2}I\omega^2 = \frac{1}{2}\left(\frac{2}{5}mr^2\right)\omega^2 = \frac{1}{5}mv^2$.

Therefore total K.E. $= \frac{1}{2}mv^2 + \frac{1}{5}mv^2 = \frac{7}{10}mv^2$.

And ratio of rotational K.E. and total K.E.

$$= \frac{(1/5)mv^2}{(7/10)mv^2} = \frac{2}{7}.$$

69. (d) : The moment of inertia is minimum about EG because mass distribution is at minimum distance from EG.

70. (a) : For solid sphere, $\frac{K^2}{R^2} = \frac{2}{5}$

For disc and solid cylinder, $\frac{K^2}{R^2} = \frac{1}{2}$

As $\frac{K^2}{R^2}$ for solid sphere is smallest, it takes minimum time to reach the bottom of the incline, disc and cylinder reach together later.

71. (a) : P.E. = total K.E

$mgh = \frac{7}{10}mv^2, v = \sqrt{\frac{10gh}{7}}$

72. (d) : Total kinetic energy =

$$E_{trans} + E_{rot} = \frac{1}{2}mv^2 + \frac{1}{2}I\omega^2$$

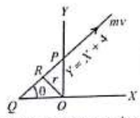
$$= \frac{1}{2}mv^2 + \frac{1}{2} \times \left(\frac{2}{5}mr^2\right)\omega^2$$

$$= \frac{1}{2}mv^2 + \frac{1}{5}mv^2 = \frac{7}{10}mv^2$$

$$\therefore \frac{E_{trans}}{E_{total}} = \frac{\frac{1}{2}mv^2}{\frac{7}{10}mv^2} = \frac{5}{7}$$

73. (a) : $\vec{L} = \vec{r} \times \vec{p}$

$Y = X + 4$ line has been shown in the figure.



When $X = 0$,

$Y = 4$, So $OP = 4$.

The slope of the line can be obtained by comparing with the equation of line

$y = mx + c$

$m = \tan\theta = 1 \quad \Rightarrow \theta = 45°$

$\angle OQP = \angle OPQ = 45°$

If we draw a line perpendicular to this line.

Length of the perpendicular = OR

$\Rightarrow OR = OP\sin 45°$

$= 4\frac{1}{\sqrt{2}} = \frac{4}{\sqrt{2}} = 2\sqrt{2}$

Angular momentum of particle going along this line

$= r \times mv = 2\sqrt{2} \times 5 \times 3\sqrt{2} = 60$ units

74. (c) : K.E. $= \frac{1}{2}I\omega^2$

$I = \frac{2\text{K.E.}}{\omega^2} = \frac{2 \times 360}{30 \times 30} = 0.8$ kgm^2

75. (b) : $I = 1.2$ kgm^2, $E_r = 1500$ J,

$\alpha = 25$ rad/s^2, $\omega_1 = 0$, $t = ?$

As $E_r = \frac{1}{2}I\omega^2, \omega = \sqrt{\frac{2E_r}{I}}$

$\omega = \sqrt{\frac{2 \times 1500}{1.2}} = 50$ rad/sec

From $\omega_2 = \omega_1 + \alpha t$,

$50 = 0 + 25t, \quad$ or $t = 2$ s.

76. (c) : Moment of inertia of uniform circular disc about diameter = I

According to theorem of perpendicular axes.

Moment of inertia of disc about axis $= 2I = \frac{1}{2}mr^2$

Applying theorem of parallel axes

Moment of inertia of disc about the given axis

$= 2I + mr^2 = 2I + 4I = 6I$.

77. (b) : Angular momentum about the point of contact with the surface includes the angular momentum about the centre. Because of friction, linear momentum will not be conserved.

78. (a) : Kinetic energy $= \frac{1}{2}I\omega^2$, and for ring $I = mr^2$

Hence KE $= \frac{1}{2}mr^2\omega^2$

CHAPTER

7 Gravitation

1. A remote-sensing satellite of earth revolves in a circular orbit at a height of 0.25×10^6 m above the surface of earth. If earth's radius is 6.38×10^6 m and $g = 9.8$ ms^{-2}, then the orbital speed of the satellite is
(a) 9.13 km s^{-1} (b) 6.67 km s^{-1}
(c) 7.76 km s^{-1} (d) 8.56 km s^{-1}
(AIPMT 2015)

2. A satellite S is moving in an elliptical orbit around the earth. The mass of the satellite is very small compared to the mass of the earth. Then,
(a) the linear momentum of S remains constant in magnitude.
(b) the acceleration of S is always directed towards the centre of the earth.
(c) the angular momentum of S about the centre of the earth changes in direction, but its magnitude remains constant.
(d) the total mechanical energy of S varies periodically with time.
(AIPMT 2015)

3. Kepler's third law states that square of period of revolution (T) of a planet around the sun, is proportional to third power of average distance r between sun and planet *i.e.* $T^2 = Kr^3$ here K is constant.
If the masses of sun and planet are M and m respectively then as per Newton's law of gravitation force of attraction between them is
$F = \frac{GMm}{r^2}$, here G is gravitational constant.
The relation between G and K is described as
(a) $K = G$ (b) $K = \frac{1}{G}$
(c) $GK = 4\pi^2$ (d) $GMK = 4\pi^2$
(AIPMT 2015, Cancelled)

4. Two spherical bodies of mass M and $5M$ and radii R and $2R$ are released in free space with initial separation between their centres equal to $12R$. If they attract each other due to gravitational force only, then the distance covered by the smaller body before collision is
(a) $7.5R$ (b) $1.5R$
(c) $2.5R$ (d) $4.5R$
(AIPMT 2015, Cancelled)

5. A black hole is an object whose gravitational field is so strong that even light cannot escape from it. To what approximate radius would earth (mass $= 5.98 \times 10^{24}$ kg) have to be compressed to be a black hole?
(a) 10^{-9} m (b) 10^{-6} m
(c) 10^{-2} m (d) 100 m
(AIPMT 2014)

6. Dependence of intensity of gravitational field (E) of earth with distance (r) from centre of earth is correctly represented by

(a)  (b) 
(c)  (d) 
(AIPMT 2014)

7. Infinite number of bodies, each of mass 2 kg are situated on x-axis at distances 1 m, 2 m, 4 m, 8 m, ... respectively, from the origin. The resulting gravitational potential due to this system at the origin will be

(a) $-\frac{4}{3}G$ (b) $-4G$
(c) $-G$ (d) $-\frac{8}{3}G$ *(NEET 2013)*

. A body of mass 'm' is taken from the earth's surface to the height equal to twice the radius (R) of the earth. The change in potential energy of body will be
(a) $3mgR$ (b) $\frac{1}{3}mgR$
(c) $mg2R$ (d) $\frac{2}{3}mgR$ *(NEET 2013)*

. The radius of a planet is twice the radius of earth. Both have almost equal average mass-densities. V_P and V_E are escape velocities of the planet and the earth, respectively, then
(a) $V_P = 1.5\ V_E$ (b) $V_P = 2\ V_E$
(c) $V_E = 3\ V_P$ (d) $V_E = 1.5\ V_P$
(Karnataka NEET 2013)

0. A particle of mass 'm' is kept at rest at a height $3R$ from the surface of earth, where 'R' is radius of earth and 'M' is mass of earth. The minimum speed with which it should be projected, so that it does not return back, is
(g is acceleration due to gravity on the surface of earth)
(a) $\left(\frac{GM}{2R}\right)^{1/2}$ (b) $\left(\frac{gR}{4}\right)^{1/2}$
(c) $\left(\frac{2g}{R}\right)^{1/2}$ (d) $\left(\frac{GM}{R}\right)^{1/2}$
(Karnataka NEET 2013)

1. The height at which the weight of a body becomes $\left(\frac{1}{16}\right)$th, its weight on the surface of earth (radius R), is
(a) $5R$ (b) $15R$
(c) $3R$ (d) $4R$ *(Prelims 2012)*

2. A spherical planet has a mass M_p and diameter D_p. A particle of mass m falling freely near the surface of this planet will experience an acceleration due to gravity, equal to
(a) $\frac{4GM_p}{D_p^2}$ (b) $\frac{GM_p m}{D_p^2}$
(c) $\frac{GM_p}{D_p^2}$ (d) $\frac{4GM_p m}{D_p^2}$
(Prelims 2012)

13. A geostationary satellite is orbiting the earth at a height of $5R$ above that surface of the earth, R being the radius of the earth. The time period of another satellite in hours at a height of $2R$ from the surface of the earth is
(a) 5 (b) 10
(c) $6\sqrt{2}$ (d) $\frac{6}{\sqrt{2}}$ *(Prelims 2012)*

14. If v_e is escape velocity and v_o is orbital velocity of a satellite for orbit close to the earth's suface, then these are related by
(a) $v_o = \sqrt{2}v_e$ (b) $v_o = v_e$
(c) $v_e = \sqrt{2v_o}$ (d) $v_e = \sqrt{2}v_o$
(Mains 2012)

15. Which one of the following plots represents the variation of gravitational field on a particle with distance r due to a thin spherical shell of radius R? (r is measured from the centre of the spherical shell)

(a)  (b) 
(c)  (d) 
(Mains 2012)

16. A planet moving along an elliptical orbit is closest to the sun at a distance r_1 and farthest away at a distance of r_2. If v_1 and v_2 are the linear velocities at these points respectively, then the ratio $\frac{v_1}{v_2}$ is
(a) $(r_1/r_2)^2$ (b) r_2/r_1
(c) $(r_2/r_1)^2$ (d) r_1/r_2 *(Prelims 2011)*

17. A particle of mass m is thrown upwards from the surface of the earth, with a velocity u. The mass and the radius of the earth are, respectively, M and R. G is gravitational constant and g is acceleration due to gravity on the surface of earth. The minimum value of u so that the particle does not return back to earth, is

(a) $\sqrt{\frac{2GM}{R^2}}$ (b) $\sqrt{\frac{2GM}{R}}$

(c) $\sqrt{\frac{2gM}{R^2}}$ (d) $\sqrt{2gR^2}$ *(Mains 2011)*

18. A particle of mass M is situated at the centre of a spherical shell of same mass and radius a. The magnitude of the gravitational potential at a point situated at $a/2$ distance from the centre, will be

(a) $\frac{GM}{a}$ (b) $\frac{2GM}{a}$

(c) $\frac{3GM}{a}$ (d) $\frac{4GM}{a}$

(Mains 2011, Prelims 2010)

19. The radii of circular orbits of two satellites A and B of the earth, are $4R$ and R, respectively. If the speed of satellite A is $3V$, then the speed of satellite B will be

(a) $\frac{3V}{4}$ (b) $6V$

(c) $12V$ (d) $\frac{3V}{2}$ *(Prelims 2010)*

20. A man of 50 kg mass is standing in a gravity free space at a height of 10 m above the floor. He throws a stone of 0.5 kg mass downwards with a speed 2 m/s. When the stone reaches the floor, the distance of the man above the floor will be

(a) 9.9 m (b) 10.1 m

(c) 10 m (d) 20 m *(Prelims 2010)*

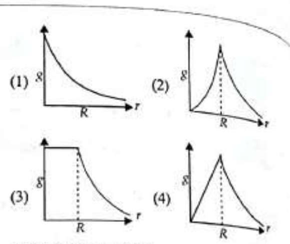
21. The additional kinetic energy to be provided to a satellite of mass m revolving around a planet of mass M, to transfer it from a circular orbit of radius R_1 to another of radius $R_2 (R_2 > R_1)$ is

(a) $GmM\left(\frac{1}{R_1^2}-\frac{1}{R_2^2}\right)$ (b) $GmM\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$

(c) $2GmM\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$ (d) $\frac{1}{2}GmM\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$

(Mains 2010)

22. The dependence of acceleration due to gravity g on the distance r from the centre of the earth, assumed to be a sphere of radius R of uniform density is as shown in figures below



The correct figure is

(a) (4) (b) (1)

(c) (2) (d) (3) *(Mains 2010)*

23. (1) Centre of gravity (C.G.) of a body is the point at which the weight of the body acts

(2) Centre of mass coincides with the centre of gravity if the earth is assumed to have infinitely large radius.

(3) To evaluate the gravitational field intensity due to any body at an external point, the entire mass of the body can be considered to be concentrated at its C.G.

(4) The radius of gyration of any body rotating about an axis is the length of the perpendicular dropped from the C.G. of the body to the axis.

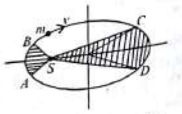
Which one of the following pairs of statements is correct?

(a) (4) and (1) (b) (1) and (2)

(c) (2) and (3) (d) (3) and (4)

(Mains 2010)

24. The figure shows elliptical orbit of a planet m about the sun S. The shaded area SCD is twice the shaded area SAB. If t_1 is the time for the planet to move from C to D and t_2 is the time to move from A to B then



(a) $t_1 = 4t_2$ (b) $t_1 = 2t_2$

(c) $t_1 = t_2$ (d) $t_1 > t_2$ *(Prelims 2009)*

25. Two satellites of earth, S_1 and S_2 are moving in the same orbit. The mass of S_1 is four times the mass of S_2. Which one of the following statements is true?

(a) The potential energies of earth and satellite in the two cases are equal.

(b) S_1 and S_2 are moving with the same speed.

(c) The kinetic energies of the two satellites are equal.

(d) The time period of S_1 is four times that of S_2.

(2007)

26. The earth is assumed to be a sphere of radius R. A platform is arranged at a height R from the surface of the earth. The escape velocity of a body from this platform is fv, where v is its escape velocity from the surface of the Earth. The value of f is

(a) 1/2 (b) $\sqrt{2}$

(c) $1/\sqrt{2}$ (d) 1/3. *(2006)*

27. Imagine a new planet having the same density as that of earth but it is 3 times bigger than the earth in size. If the acceleration due to gravity on the surface of earth is g and that on the surface of the new planet is g', then

(a) $g' = g/9$ (b) $g' = 27g$

(c) $g' = 9g$ (d) $g' = 3g$. *(2005)*

28. For a satellite moving in an orbit around the earth, the ratio of kinetic energy to potential energy is

(a) 1/2 (b) $1/\sqrt{2}$

(c) 2 (d) $\sqrt{2}$ *(2005)*

29. The density of a newly discovered planet is twice that of earth. The acceleration due to gravity at the surface of the planet is equal to that at the surface of the earth. If the radius of the earth is R, the radius of the planet would be

(a) $2R$ (b) $4R$

(c) $\frac{1}{4}R$ (d) $\frac{1}{2}R$ *(2004)*

30. Two spheres of masses m and M are situated in air and the gravitational force between them is F. The space around the masses is now filled with a liquid of specific gravity 3. The gravitational force will now be

(a) $3F$ (b) F

(c) $F/3$ (d) $F/9$ *(2003)*

31. The acceleration due to gravity on the planet A is 9 times the acceleration due to gravity on planet B. A man jumps to a height of 2 m on the surface of A. What is the height of jump by the same person on the planet B?

(a) (2/9) m (b) 18 m

(c) 6 m (d) (2/3) m *(2003)*

32. A body of mass m is placed on earth surface which is taken from earth surface to a height of $h = 3R$, then change in gravitational potential energy is

(a) $\frac{mgR}{4}$ (b) $\frac{2}{3}mgR$

(c) $\frac{3}{4}mgR$ (d) $\frac{mgR}{2}$ *(2002)*

33. With what velocity should a particle be projected so that its height becomes equal to radius of earth?

(a) $\left(\frac{GM}{R}\right)^{1/2}$ (b) $\left(\frac{8GM}{R}\right)^{1/2}$

(c) $\left(\frac{2GM}{R}\right)^{1/2}$ (d) $\left(\frac{4GM}{R}\right)^{1/2}$ *(2001)*

34. For a planet having mass equal to mass of the earth but radius is one fourth of radius of the earth. Then escape velocity for this planet will be

(a) 11.2 km/sec (b) 22.4 km/sec

(c) 5.6 km/sec (d) 44.8 km/sec.

(2000)

35. Gravitational force is required for

(a) stirring of liquid (b) convection

(c) conduction (d) radiation. *(2000)*

36. A body of weight 72 N moves from the surface of earth at a height half of the radius of earth, then gravitational force exerted on it will be

(a) 36 N (b) 32 N

(c) 144 N (d) 50 N. *(2000)*

37. The escape velocity of a sphere of mass m is given by (G = Universal gravitational constant; M_e = Mass of the earth and R_e = Radius of the earth)

(a) $\sqrt{\frac{2GM_e m}{R_e}}$ (b) $\sqrt{\frac{2GM_e}{R_e}}$

(c) $\sqrt{\frac{GM_e}{R_e}}$ (d) $\sqrt{\frac{2GM_e + R_e}{R_e}}$ *(1999)*

38. The escape velocity of a body on the surface of the earth is 11.2 km/s. If the earth's mass increases to twice its present value and radius of the earth becomes half, the escape velocity becomes
(a) 22.4 km/s (b) 44.8 km/s
(c) 5.6 km/s (d) 11.2 km/s. *(1997)*

39. The period of revolution of planet A around the sun is 8 times that of B. The distance of A from the sun is how many times greater than that of B from the sun?
(a) 4 (b) 5
(c) 2 (d) 3. *(1997)*

40. What will be the formula of mass of the earth in terms of g, R and G?
(a) $G\frac{R}{g}$ (b) $g\frac{R^2}{G}$
(c) $g^2\frac{R}{G}$ (d) $G\frac{g}{R}$. *(1996)*

41. A ball is dropped from a spacecraft revolving around the earth at a height of 120 km. What will happen to the ball?
(a) it will fall down to the earth gradually
(b) it will go very far in the space
(c) it will continue to move with the same speed along the original orbit of spacecraft
(d) it will move with the same speed, tangentially to the spacecraft. *(1996)*

42. The acceleration due to gravity g and mean density of the earth ρ are related by which of the following relations? (where G is the gravitational constant and R is the radius of the earth.)
(a) $\rho = \frac{3g}{4\pi GR}$ (b) $\rho = \frac{3g}{4\pi GR^3}$
(c) $\rho = \frac{4\pi gR^2}{3G}$ (d) $\rho = \frac{4\pi gR^3}{3G}$. *(1995)*

43. Two particles of equal mass go around a circle of radius R under the action of their mutual gravitational attraction. The speed v of each particle is
(a) $\frac{1}{2}\sqrt{\frac{Gm}{R}}$ (b) $\sqrt{\frac{4Gm}{R}}$
(c) $\frac{1}{2R}\sqrt{\frac{1}{Gm}}$ (d) $\sqrt{\frac{Gm}{R}}$. *(1995)*

44. The earth (mass = 6×10^{24} kg) revolves around the sun with an angular velocity of 2×10^{-7} rad/s in a circular orbit of radius 1.5×10^8 km. The force exerted by the sun on the earth, in newton, is
(a) 36×10^{21} (b) 27×10^{39}
(c) zero (d) 18×10^{25}. *(1995)*

45. The radius of earth is about 6400 km and that of mars is 3200 km. The mass of the earth is about 10 times mass of mars. An object weighs 200 N on the surface of earth. Its weight on the surface of mars will be
(a) 20 N (b) 8 N
(c) 80 N (d) 40 N. *(1994)*

46. The distance of two planets from the sun are 10^{13} m and 10^{12} m respectively. The ratio of time periods of the planets is
(a) $\sqrt{10}$ (b) $10\sqrt{10}$
(c) 10 (d) $1/\sqrt{10}$ *(1994, 88)*

47. If the gravitational force between two objects were proportional to $1/R$ (and not as $1/R^2$), where R is the distance between them, then a particle in a circular path (under such a force) would have its orbital speed v, proportional to
(a) R (b) R^0 (independent of R)
(c) $1/R^2$ (d) $1/R$. *(1994, 89)*

48. A satellite in force free space sweeps stationary interplanetary dust at a rate of $dM/dt = \alpha v$, where M is mass and v is the speed of satellite and α is a constant. The acceleration of satellite is
(a) $\frac{-\alpha v^2}{2M}$ (b) $-\alpha v^2$
(c) $\frac{-2\alpha v^2}{M}$ (d) $\frac{-\alpha v^2}{M}$ *(1994)*

49. The escape velocity from earth is 11.2 km/s. If a body is to be projected in a direction making an angle 45° to the vertical, then the escape velocity is
(a) 11.2×2 km/s (b) 11.2 km/s
(c) $11.2/\sqrt{2}$ km/s (d) $11.2\sqrt{2}$ km/s *(1993)*

50. A satellite A of mass m is at a distance of r from the surface of the earth. Another satellite B of mass $2m$ is at a distance of $2r$ from the earth's centre. Their time periods are in the ratio of
(a) 1 : 2 (b) 1 : 16
(c) 1 : 32 (d) $1 : 2\sqrt{2}$ *(1993)*

51. The mean radius of earth is R, its angular speed on its own axis is ω and the acceleration due to gravity at earth's surface is g. What will be the radius of the orbit of a geostationary satellite?
(a) $(R^2g/\omega^2)^{1/3}$ (b) $(Rg/\omega^2)^{1/3}$
(c) $(R^2\omega^2/g)^{1/3}$ (d) $(R^2g/\omega)^{1/3}$ *(1992)*

52. The satellite of mass m is orbiting around the earth in a circular orbit with a velocity v. What will be its total energy?
(a) $(3/4)mv^2$ (b) $(1/2)mv^2$
(c) mv^2 (d) $-(1/2)mv^2$ *(1991)*

53. A planet is moving in an elliptical orbit around the sun. If T, V, E and L stand respectively for its kinetic energy, gravitational potential energy, total energy and magnitude of angular momentum about the centre of force, which of the following is correct?
(a) T is conserved
(b) V is always positive
(c) E is always negative
(d) L is conserved but direction of vector L changes continously. *(1990)*

54. For a satellite escape velocity is 11 km/s. If the satellite is launched at an angle of 60° with the vertical, then escape velocity will be
(a) 11 km/s (b) $11\sqrt{3}$ km/s
(c) $\frac{11}{\sqrt{3}}$ km/s (d) 33 km/s *(1989)*

55. The largest and the shortest distance of the earth from the sun are r_1 and r_2. Its distance from the sun when it is at perpendicular to the major-axis of the orbit drawn from the sun is
(a) $\frac{r_1 + r_2}{4}$ (b) $\frac{r_1 + r_2}{r_1 - r_2}$
(c) $\frac{2r_1r_2}{r_1 + r_2}$ (d) $\frac{r_1 + r_2}{3}$ *(1988)*

EXPLANATIONS

1. **(c) :** The orbital speed of the satellite is

$$v_o = R\sqrt{\frac{g}{(R+h)}}$$

where R is the earth's radius, g is the acceleration due to gravity on earth's surface and h is the height above the surface of earth.
Here, $R = 6.38 \times 10^6$m, $g = 9.8$ m s^{-2} and $h = 0.25 \times 10^6$ m

$$\therefore v_o = (6.38\times10^6 \text{m})\sqrt{\frac{(9.8 \text{ m s}^{-2})}{(6.38\times10^6 \text{ m}+0.25\times10^6 \text{m})}}$$

$$= 7.76 \times 10^3 \text{ m s}^{-1} = 7.76 \text{ km s}^{-1}$$

$(\because 1 \text{ km} = 10^3 \text{ m})$

2. **(b) :** The gravitational force on the satellite S acts towards the centre of the earth, so the acceleration of the satellite S is always directed towards the centre of the earth.

3. **(d) :** Gravitational force of attraction between sun and planet provides centripetal force for the orbit of planet.

$$\therefore \quad \frac{GMm}{r^2} = \frac{mv^2}{r}$$

$$v^2 = \frac{GM}{r} \quad \text{...(i)}$$

Time period of the planet is given by

$$T = \frac{2\pi r}{v}, \quad T^2 = \frac{4\pi^2 r^2}{v^2}$$

$$T^2 = \frac{4\pi^2 r^2}{\left(\frac{GM}{r}\right)} \quad \text{[Using equation (i)]}$$

$$T^2 = \frac{4\pi^2 r^3}{GM} \quad \text{...(ii)}$$

According to question,

$$T^2 = Kr^3 \quad \text{...(iii)}$$

Comparing equations (ii) and (iii), we get

$$K = \frac{4\pi^2}{GM} \quad \therefore GMK = 4\pi^2$$

4. **(a)**

5. **(c) :** Light cannot escape from a black hole, $v_{esc} = c$

$$\sqrt{\frac{2GM}{R}} = c \quad \text{or} \quad R = \frac{2GM}{c^2}$$

$$R = \frac{2\times6.67\times10^{-11} \text{ N m}^2\text{kg}^{-2}\times5.98\times10^{24}\text{kg}}{(3\times10^8 \text{ m s}^{-1})^2}$$

$$= 8.86 \times 10^{-3} \text{ m} \approx 10^{-2} \text{ m}$$

6. **(a) :** For a point inside the earth *i.e.* $r < R$

$$E = -\frac{GM}{R^3}r$$

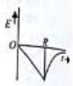
where M and R be mass and radius of the earth respectively.
At the centre, $r = 0$
$\therefore E = 0$
For a point outside the earth *i.e.* $r > R$,

$$E = -\frac{GM}{r^2}$$

On the surface of the earth *i.e.* $r = R$,

$$E = -\frac{GM}{R^2}$$

The variation of E with distance r from the centre is as shown in the figure.



7. **(b) :** The resulting gravitational potential at the origin O due to each of mass 2 kg located at positions as shown in figure is

O	2 kg	2 kg	2 kg	2 kg
$x = 0$	1	2	4	8

$$V = -\frac{G\times2}{1} - \frac{G\times2}{2} - \frac{G\times2}{4} - \frac{G\times2}{8} - ...$$

$$= -2G\left[1+\frac{1}{2}+\frac{1}{4}+\frac{1}{8}+......\right] = -2G\left[\frac{1}{1-\frac{1}{2}}\right]$$

$$= -2G\left[\frac{2}{1}\right] = -4G$$

8. **(d) :** Gravitational potential energy at any point at a distance r from the centre of the earth is

$$U = -\frac{GMm}{r}$$

where M and m be masses of the earth and the body respectively.
At the surface of the earth, $r = R$

$$\therefore \quad U_i = -\frac{GMm}{R}$$

At a height h from the surface,
$r = R + h = R + 2R \quad (h = 2R \text{ (Given)})$
$= 3R$

$$\therefore \quad U_f = -\frac{GMm}{3R}$$

Change in potential energy,

$$\Delta U = U_f - U_i$$

$$= -\frac{GMm}{3R} - \left(-\frac{GMm}{R}\right)$$

$$= \frac{GMm}{R}\left(1-\frac{1}{3}\right) = \frac{2}{3}\frac{GMm}{R}$$

$$= \frac{2}{3}mgR \quad \left(\because g = \frac{GM}{R^2}\right)$$

9. **(b) :** Here, $R_P = 2R_E$, $\rho_E = \rho_P$
Escape velocity of the earth,

$$V_E = \sqrt{\frac{2GM_E}{R_E}} = \sqrt{\frac{2G}{R_E}\left(\frac{4}{3}\pi R_E^3\rho_E\right)} = R_E\sqrt{\frac{8}{3}\pi G\rho_E} \quad \text{...(i)}$$

Escape velocity of the planet

$$V_P = \sqrt{\frac{2GM_P}{R_P}} = \sqrt{\frac{2G}{R_P}\left(\frac{4}{3}\pi R_P^3\rho_P\right)} = R_P\sqrt{\frac{8}{3}\pi G\rho_P} \quad \text{...(ii)}$$

Divide (i) by (ii), we get

$$\frac{V_E}{V_P} = \frac{R_E}{R_P}\sqrt{\frac{\rho_E}{\rho_P}}$$

$$\frac{V_E}{V_P} = \frac{R_E}{2R_E}\sqrt{\frac{\rho_E}{\rho_E}} = \frac{1}{2}$$

or $V_P = 2V_E$

10. **(a) :** The minimum speed with which the particle should be projected from the surface of the earth so that it does not return back is known as escape speed and it is given by

$$v_e = \sqrt{\frac{2GM}{(R+h)}}$$

Here, $h = 3R$

$$\therefore \quad v_e = \sqrt{\frac{2GM}{(R+3R)}} = \sqrt{\frac{2GM}{4R}} = \sqrt{\frac{GM}{2R}}$$

$$= \sqrt{\frac{gR}{2}} \quad \left(\because g = \frac{GM}{R^2}\right)$$

11. **(c) :** Acceleration due to gravity at a height h from the surface of earth is

$$g' = \frac{g}{\left(1+\frac{h}{R}\right)^2} \quad \text{....(i)}$$

where g is the acceleration due to gravity at the surface of earth and R is the radius of earth. Multiplying by m (mass of the body) on both sides in (i), we get

$$mg' = \frac{mg}{\left(1+\frac{h}{R}\right)^2}$$

$\therefore$ Weight of body at height h, $W' = mg'$
Weight of body at surface of earth, $W = mg$
According to question, $W' = \frac{1}{16}W$

$$\therefore \quad \frac{1}{16} = \frac{1}{\left(1+\frac{h}{R}\right)^2}$$

$$\left(1+\frac{h}{R}\right)^2 = 16 \quad \text{or} \quad 1+\frac{h}{R} = 4$$

$$\text{or} \quad \frac{h}{R} = 3 \quad \text{or} \quad h = 3R$$

12. **(a) :** Gravitational force acting on particle of mass m is

$$F = \frac{GM_pm}{(D_p/2)^2}$$

Acceleration due to gravity experience by the particle is

$$g = \frac{F}{m} = \frac{GM_p}{(D_p/2)^2} = \frac{4GM_p}{D_p^2}$$

13. **(c) :** According to Kepler's third law $T \propto r^{3/2}$

$$\therefore \quad \frac{T_2}{T_1} = \left(\frac{r_2}{r_1}\right)^{3/2} = \left(\frac{R+2R}{R+5R}\right)^{3/2} = \frac{1}{2^{3/2}}$$

Since $T_1 = 24$ hours

$$\text{So, } \frac{T_2}{24} = \frac{1}{2^{3/2}} \quad \text{or} \quad T_2 = \frac{24}{2^{3/2}} = \frac{24}{2\sqrt{2}} = 6\sqrt{2} \text{ hours}$$

14. **(d) :** Escape velocity, $v_e = \sqrt{\frac{2GM}{R}}$ ...(i)
where M and R be the mass and radius of the earth respectively.

Scanned by CamScanner

The orbital velocity of a satellite close to the earth's surface is

$$v_o = \sqrt{\frac{GM}{R}} \quad ...(ii)$$

From (i) and (ii), we get

$$v_e = \sqrt{2}v_o$$

15. (b) : Gravitational field due to the thin spherical shell

Inside the shell, *i.e.* (For $r < R$)

$$F = 0$$

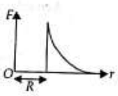
On the surface of the shell, *i.e.* (For $r = R$)

$$F = \frac{GM}{R^2}$$

Outside the shell, *i.e.* (For $r > R$)

$$F = \frac{GM}{r^2}$$

The variation of F with distance r from the centre is as shown in the adjacent figure.



16. (b) : According to the law of conservation of angular momentum

$$L_1 = L_2$$

$$mv_1r_1 = mv_2r_2 \Rightarrow v_1r_1 = v_2r_2 \text{ or } \frac{v_1}{v_2} = \frac{r_2}{r_1}$$

17. (b) : According to law of conservation of mechanical energy

$$\frac{1}{2}mu^2 - \frac{GMm}{R} = 0 \text{ or } u^2 = \frac{2GM}{R}$$

$$u = \sqrt{\frac{2GM}{R}} = \sqrt{2gR} \qquad \left(\because g = \frac{GM}{R^2}\right)$$

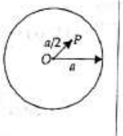
18. (c) : Here,

Mass of a particle = M

Mass of a spherical shell = M

Radius of a spherical shell = a

Let O be centre of a spherical shell.



Gravitational potential at point P due to particle at O is

$$V_1 = -\frac{GM}{a/2}$$

Gravitational potential at point P due to spherical shell is

$$V_2 = -\frac{GM}{a}$$

Hence, total gravitational potential at point P

$$V = V_1 + V_2$$

$$= -\frac{GM}{a/2} + \left(\frac{-GM}{a}\right) = -\frac{2GM}{a} - \frac{GM}{a} = -\frac{3GM}{a}$$

$$|V| = \frac{3GM}{a}$$

19. (b) : Orbit speed of the satellite around the earth

$$v = \sqrt{\frac{GM}{r}}$$

where,

G = Universal gravitational constant

M = Mass of earth

r = Radius of the orbit of the satellite

For satellite A

$$r_A = 4R,\ v_A = 3V$$

$$v_A = \sqrt{\frac{GM}{r_A}}$$

For satellite B

$$r_B = R,\ v_B = ?$$

$$v_B = \sqrt{\frac{GM}{r_B}}$$

Dividing equation (ii) by equation (i), we get

$$\therefore \frac{v_B}{v_A} = \sqrt{\frac{r_A}{r_B}} \text{ or } v_B = v_A\sqrt{\frac{r_A}{r_B}}$$

Substituting the given values, we get

$$v_B = 3V\sqrt{\frac{4R}{R}} \text{ or } v_B = 6V$$

20. (b) : Since the man is in gravity free space, force on man + stone system is zero.

Therefore centre of mass of the system remains at rest. Let the man goes x m above when the stone reaches the floor, then

$$M_{man} \times x = M_{stone} \times 10$$

$$x = \frac{0.5}{50} \times 10$$

$x = 0.1$ m

Therefore final height of man above floor = $10 + x$

$= 10 + 0.1 = 10.1$ m

21. (d)

22. (a) : The acceleration due to gravity at a depth d below surface of earth is

$$g' = \frac{GM}{R^2}\left(1 - \frac{d}{R}\right) = g\left(1 - \frac{d}{R}\right)$$

$g' = 0$ at $d = R$.

i.e., acceleration due to gravity is zero at the centre of earth.

Thus, the variation in value g with r is

For, $r > R$,

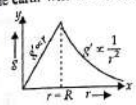
$$g' = \frac{g}{\left(1 + \frac{h}{R}\right)^2} = \frac{gR^2}{r^2} \Rightarrow g' \propto \frac{1}{r^2}$$

Here, $R + h = r$

For $r < R$, $g' = g\left(1 - \frac{d}{R}\right) = \frac{gr}{R}$

Here, $R - d = r \Rightarrow g' \propto r$

Therefore, the variation of g with distance from centre of the earth will be as shown in the figure.



23. (a)

24. (b) : Equal areas are swept in equal time.

t_1, the time taken to go from C to $D = 2t_2$

where t_2 is the time taken to go from A to B.

As it is given that area $SCD = 2SAB$.

25. (b) : The satellite of mass m is moving in a circular orbit of radius r.

$\therefore$ Kinetic energy of the satellite, $K = \frac{GMm}{2r}$ ... (i)

Potential energy of the satellite, $U = \frac{-GMm}{r}$ ... (ii)

Orbital speed of satellite, $v = \sqrt{\frac{GM}{r}}$ ... (iii)

Time-period of satellite, $T = \left[\left(\frac{4\pi^2}{GM}\right)r^3\right]^{1/2}$ ... (iv)

Given $m_{S_1} = 4m_{S_2}$

Since M, r is same for both the satellites S_1 and S_2

$\therefore$ From equation (ii), we get $U \propto m$

$$\therefore \frac{U_{S_1}}{U_{S_2}} = \frac{m_{S_1}}{m_{S_2}} = 4 \text{ or, } U_{S_1} = 4U_{S_2}.$$

Option (a) is wrong.

From (iii), since v is independent of the mass of a satellite, the orbital speed is same for both satellites S_1 and S_2.

Hence option (b) is correct.

From (i), we get $K \propto m$

$$\therefore \frac{K_{S_1}}{K_{S_2}} = \frac{m_{S_1}}{m_{S_2}} = 4 \text{ or, } K_{S_1} = 4K_{S_2}.$$

Hence option (c) is wrong.

From (iv), since T is independent of the mass of a satellite, time period is same for both the satellites S_1 and S_2. Hence option (d) is wrong.

26. (c) : Escape velocity of the body from the surface of earth is $v = \sqrt{2gR}$

For escape velocity of the body from the platform potential energy + kinetic energy = 0

$$-\frac{GMm}{2R} + \frac{1}{2}mv^2 = 0$$

$$\Rightarrow fv_{escape} = \sqrt{\frac{GM}{R^2} \cdot R} = \sqrt{gR} = fv$$

From the surface of the earth, $v_{escape} = \sqrt{2gR}$

$$\therefore fv_{escape} = \frac{v_{escape}}{\sqrt{2}}. \therefore f = \frac{1}{\sqrt{2}}.$$

27. (d) : $g = \frac{GM}{r^2}$ and $g' = \frac{GM'}{r^2}$ $[M' = 3M]$

$$\frac{g'}{g} = \frac{3M}{M} \Rightarrow g' = 3g.$$

28. (a) : $-\frac{GMm}{R^2} + m\omega^2R = 0$

$$\therefore \frac{GMm}{R^2} = m\omega^2R$$

$$K.E. = \frac{1}{2}I\omega^2 = \frac{1}{2}mR^2\omega^2 = \frac{GMm}{2R}$$

$$P.E. = -\frac{GMm}{R}.$$

$$\therefore K.E. = \frac{|P.E.|}{2}$$

$$\therefore \frac{K.E.}{|P.E.|} = \frac{1}{2}.$$

29. (d) : From equation of acceleration due to gravity.

$$g_e = \frac{GM_e}{R_e^2} = \frac{G(4/3)\pi R_e^3}{R_e^2}\rho_e$$

$$g_e \propto R_e\rho_e$$

acceleration due to gravity of planet $g_p \propto R_p \rho_p$

$R_e\rho_e = R_p\rho_p \Rightarrow R_e\rho_e = R_p 2\rho_e \Rightarrow R_p = \frac{1}{2}R$
$(\because R_e = R)$

30. (b) : The gravitational force does not depend upon the medium in which objects are placed.

31. (b) : The velocity of the mass while reaching the surface of both the planets will be same.

i.e., $\sqrt{2g'h'} = \sqrt{2gh}$

$\sqrt{2 \times g \times h'} = \sqrt{2 \times 9g \times 2}$ $\quad 2h' = 36 \Rightarrow h' = 18$ m.

32. (c) : Gravitational potential energy on earth's surface $= -\frac{GMm}{R}$, where M and R are the mass and radius of the earth respectively, m is the mass of the body and G is the universal gravitational constant. Gravitational potential energy at a height $h = 3R$

$$= -\frac{GMm}{R+h} = -\frac{GMm}{R+3R} = -\frac{GMm}{4R}$$

$\therefore$ Change in potential energy

$$= -\frac{GMm}{4R} - \left(-\frac{GMm}{R}\right)$$

$$= -\frac{GMm}{4R} + \frac{GMm}{R} = \frac{3}{4}\frac{GMm}{R}.$$

Again, we have, $\frac{GMm}{R^2} = mg$

(where g is acceleration due to gravity on earth's surface).

$\therefore \frac{GMm}{R} = mgR$.

$\therefore$ Change in potential energy $= \frac{3}{4}mgR$.

33. (a) : Use $v^2 = \frac{2gh}{1+\frac{h}{R}}$ given $h = R$.

$\therefore v = \sqrt{gR} = \sqrt{\frac{GM}{R}}$.

34. (b) : $v_e = \sqrt{2gR} = \sqrt{\frac{2GM}{R}}$

If R is 1/4th then $v_e = 2\ v_{e\text{-earth}}$

$= 2 \times 11.2 = 22.4$ km/sec.

35. (b)

36. (b) : $F_{surface} = G\frac{Mm}{R_e^2}$

$$F_{R_e/2} = G\frac{Mm}{(R_e + R_e/2)^2} = \frac{4}{9} \times F_{surface} = \frac{4}{9} \times 72 = 32\text{ N}.$$

37. (b) : The gravitational potential energy of a body of mass m placed on earth's surface is given by

$U = -\frac{GM_e m}{R_e}$

Threfore, in order to take a body from the earth's surface to infinity, the work required is $\frac{GM_e m}{R_e}$. Hence it is evident that if we throw a body of mass m with such a velocity that its kinetic energy is $\frac{GM_e m}{R_e}$, then it will move outside the gravitational field of earth. Hence,

$\frac{1}{2}mv_e^2 = \frac{GM_e m}{R_e}$ or, $v_e = \sqrt{\frac{2GM_e}{R_e}}$.

38. (a) : Escape velocity of a body $(v_e) = 11.2$ km/s. New mass of the earth $M'_e = 2M_e$ and new radius of the earth $R'_e = 0.5\,R_e$.

Escape velocity $(v_e) = \sqrt{\frac{2GM_e}{R_e}} \propto \sqrt{\frac{M_e}{R_e}}$.

Therefore $\frac{v_e}{v'_e} = \sqrt{\frac{M_e}{R_e} \times \frac{0.5R_e}{2M_e}} = \sqrt{\frac{1}{4}} = \frac{1}{2}$

or, $v'_e = 2v_e = 22.4$ km/sec.

39. (a) : Period of revolution of planet A $(T_A) = 8T_B$. According to Kepler's III law of planetary motion $T^2 \propto R^3$.

Therefore $\left(\frac{r_A}{r_B}\right)^3 = \left(\frac{T_A}{T_B}\right)^2 = \left(\frac{8T_B}{T_B}\right)^2 = 64$

or $\frac{r_A}{r_B} = 4$ or $r_A = 4r_B$.

40. (b) : The gravitational force $(F) = \frac{GMm}{R^2}$ and $F = mg$. Equating both the values of gravitational force, $\frac{GMm}{R^2} = mg$ or $M = g\frac{R^2}{G}$, where M is the mass of the earth.

41. (c) : Since no external torque is applied therefore according to law of conservation of angular momentum, the ball will continue to move with the same angular velocity along the original orbit of the spacecraft.

42. (a) : Acceleration due to gravity $(g) = G \times \frac{M}{R^2}$

$$= G\frac{(4/3)\pi R^3 \times \rho}{R^2} = G \times \frac{4}{3}\pi R \times \rho \text{ or } \rho = \frac{3g}{4\pi GR}.$$

43. (d) : The two masses, separated by a distance $2R$ are going round their common centre of mass, the centre of the circle.

Attractive force $= -G\frac{mm}{R^2}$. But the two masses are going round the centre of mass or the reduced mass $\mu = \frac{mm}{m+m}$ is going round a circle of radius = distance of separation

$\therefore$ Centrifugal force $= \frac{m}{2}\omega^2.2R = \frac{m}{2}v^2.\frac{1}{2R}$

Now, $\frac{m}{2} \times \frac{v^2}{2R} = \frac{Gm^2}{4R^2} \Rightarrow v = \sqrt{\frac{Gm}{R}}$

44. (a) : Mass $(m) = 6 \times 10^{24}$ kg;

Angular velocity $(\omega) = 2 \times 10^{-7}$ rad/s and radius $(r) = 1.5 \times 10^8$ km $= 1.5 \times 10^{11}$ m.

Force exerted on the earth $= mR\omega^2$

$= (6 \times 10^{24}) \times (1.5 \times 10^{11}) \times (2 \times 10^{-7})^2$

$= 36 \times 10^{21}$ N.

45. (c) : Radius of earth $(R_e) = 6400$ km; Radius of mars $(R_m) = 3200$ km; Mass of earth $(M_e) = 10$ and weight of the object on earth $(W_e) = 200$ N.

$$\frac{W_m}{W_e} = \frac{mg_m}{mg_e} = \frac{M_m}{M_e} \times \left(\frac{R_e}{R_m}\right)^2 = \frac{1}{10} \times (2)^2$$

$$= \frac{4}{10} = \frac{2}{5} \quad \text{or } W_m = W_e \times \frac{2}{5} = 200 \times 0.4 = 80\text{ N}.$$

46. (b): Distance of two planets from sun $(r_1) = 10^{13}$ m and $(r_2) = 10^{12}$ m.

Relation between time period (T) and distance of the planet from the sun is $T^2 \propto r^3$ or $T \propto r^{3/2}$.

Therefore $\frac{T_1}{T_2} = \left(\frac{r_1}{r_2}\right)^{3/2} = \left(\frac{10^{13}}{10^{12}}\right)^{3/2} = 10^{3/2} = 10\sqrt{10}$.

47. (b) : Centripetal force $(F) = \frac{mv^2}{R}$ and the gravitational force $(F) = \frac{GMm}{R^2} = \frac{GMm}{R}$ (where $R^2 \to R$). Since $\frac{mv^2}{R} = \frac{GMm}{R}$, therefore $v = \sqrt{GM}$. Thus velocity v is independent of R.

48. (d) : Rate of change of mass $\frac{dM}{dt} = \alpha v$.

Retarding force = Rate of change of momentum

= Velocity × Rate of change in mass $= -v \times \frac{dM}{dt}$

$= -v \times \alpha v = -\alpha v^2$. (Minus sign of v due to deceleration)

Therefore Acceleration $= -\frac{\alpha v^2}{M}$.

49. (b) : Escape velocity does not depend on the angle of projection.

50. (d) : Time period does not depend on the mass.

As $T^2 \propto r^3$.

$\frac{T_A}{T_B} = \frac{r^{3/2}}{2^{3/2} r^{3/2}} = 1 : 2\sqrt{2}$

51. (a) : $\frac{GMm}{r^2} = m\omega^2 r \Rightarrow r^3 = \frac{GM}{\omega^2} = \frac{gR^2}{\omega^2}$

$\therefore r = \{gR^2/\omega^2\}^{1/3}$.

52. (d) : Total energy = –K.E

K.E $= \frac{|\text{P.E.}|}{2}$

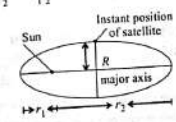
K.E. $= \frac{1}{2}mv^2$

53. (c) : In a circular or elliptical orbital motion torque is always acting parallel to displacement or velocity. So, angular momentum is conserved. In attractive field, potential energy is negative. Kinetic energy changes as velocity increase when distance is less. But if the motion is in a plane, the direction of L does not change.

54. (a) : Since escape velocity $\left(v_e = \sqrt{2gR_e}\right)$ is independent of angle of projection, so it will not cange.

55. (c) : Applying the properties of ellipse, we have

$\frac{2}{R} = \frac{1}{r_1} + \frac{1}{r_2} = \frac{r_1 + r_2}{r_1 r_2}$ 1



$R = \frac{2r_1 r_2}{r_1 + r_2}$

CHAPTER

8 Properties of Matter

1. The cylindrical tube of a spray pump has radius R, one end of which has n fine holes, each of radius r. If the speed of the liquid in the tube is V, the speed of the ejection of the liquid through the holes is

(a) $\frac{VR^2}{n^3r^2}$ (b) $\frac{V^2R}{nr}$

(c) $\frac{VR^2}{n^2r^2}$ (d) $\frac{VR^2}{nr^2}$

(AIPMT 2015)

2. Water rises to a height h in capillary tube. If the length of capillary tube above the surface of water is made less than h, then
   (a) water rises upto a point a little below the top and stays there.
   (b) water does not rise at all.
   (c) water rises upto the tip of capillary tube and then starts overflowing like a fountain.
   (d) water rises upto the top of capillary tube and stays there without overflowing.

(AIPMT 2015)

3. The value of coefficient of volume expansion of glycerin is 5×10^{-4} K^{-1}. The fractional change in the density of glycerin for a rise of 40°C in its temperature, is

(a) 0.025 (b) 0.010
(c) 0.015 (d) 0.020

(AIPMT 2015)

4. The Young's modulus of steel is twice that of brass. Two wires of same length and of same area of cross section, one of steel and another of brass are suspended from the same roof. If we want the lower ends of the wires to be at the same level, then the weights added to the steel and brass wires must be in the ratio of

(a) 4 : 1 (b) 1 : 1
(c) 1 : 2 (d) 2 : 1

(AIPMT 2015)

5. The two ends of a metal rod are maintained at temperatures 100°C and 110°C. The rate of heat flow in the rod is found to be 4.0 J/s. If the ends are maintained at temperatures 200°C and 210°C, the rate of heat flow will be

(a) 8.0 J/s (b) 4.0 J/s
(c) 44.0 J/s (d) 16.8 J/s

(AIPMT 2015, Cancelled)

6. A wind with speed 40 m/s blows parallel to the roof of a house. The area of the roof is 250 m^2. Assuming that the pressure inside the house is atmospheric pressure, the force exerted by the wind on the roof and the direction of the force will be
($\rho_{air} = 1.2$ kg/m^3)

(a) 2.4×10^5 N, upwards
(b) 2.4×10^5 N, downwards
(c) 4.8×10^5 N, downwards
(d) 4.8×10^5 N, upwards

(AIPMT 2015, Cancelled)

7. On observing light from three different stars P, Q and R, it was found that intensity of violet colour is maximum in the spectrum of P, the intensity of green colour is maximum in the spectrum of R and the intensity of red colour is maximum in the spectrum of Q. If T_P, T_Q and T_R are the respective absolute temperatures of P, Q and R, then it can be concluded from the above observations that

(a) $T_P < T_R < T_Q$ (b) $T_P < T_Q < T_R$
(c) $T_P > T_Q > T_R$ (d) $T_P > T_R > T_Q$

(AIPMT 2015, Cancelled)

8. The approximate depth of an ocean is 2700 m. The compressibility of water is 45.4×10^{-11} Pa^{-1} and density of water is 10^3 kg/m^3. What fractional compression of water will be obtained at the bottom of the ocean?

(a) 1.2×10^{-2} (b) 1.4×10^{-2}
(c) 0.8×10^{-2} (d) 1.0×10^{-2}

(AIPMT 2015, Cancelled)

9. Copper of fixed volume V is drawn into wire of length l. When this wire is subjected to a constant force F, the extension produced in the wire is Δl. Which of the following graphs is a straight line?

(a) Δl versus $1/l$ (b) Δl versus l^2
(c) Δl versus $1/l^2$ (d) Δl versus l

(AIPMT 2014)

10. A certain number of spherical drops of a liquid of radius r coalesce to form a single drop of radius R and volume V. If T is the surface tension of the liquid, then

(a) energy $= 4VT\left(\frac{1}{r} - \frac{1}{R}\right)$ is released.

(b) energy $= 3VT\left(\frac{1}{r} + \frac{1}{R}\right)$ is absorbed.

(c) energy $= 3VT\left(\frac{1}{r} - \frac{1}{R}\right)$ is released.

(d) energy is neither released nor absorbed.

(AIPMT 2014)

11. Steam at 100°C is passed into 20 g of water at 10°C. When water acquires a temperature of 80°C, the mass of water present will be
[Take specific heat of water = 1 cal g^{-1} °C^{-1} and latent heat of steam = 540 cal g^{-1}]

(a) 24 g (b) 31.5 g
(c) 42.5 g (d) 22.5 g

(AIPMT 2014)

12. Certain quantity of water cools from 70°C to 60°C in the first 5 minutes and to 54°C in the next 5 minutes. The temperature of the surroundings is

(a) 45°C (b) 20°C
(c) 42°C (d) 10°C

(AIPMT 2014)

13. A piece of iron is heated in a flame. It first becomes dull red then becomes reddish yellow and finally turns to white hot. The correct explanation for the above observation is possible by using
   (a) Kirchhoff's Law
   (b) Newton's Law of cooling
   (c) Stefan's Law
   (d) Wien's displacement Law

(NEET 2013)

14. The wettability of a surface by a liquid depends primarily on
   (a) density
   (b) angle of contact between the surface and the liquid
   (c) viscosity
   (d) surface tension

(NEET 2013)

15. The following four wires are made of the same material. Which of these will have the largest extension when the same tension is applied?
   (a) length = 200 cm, diameter = 2 mm
   (b) length = 300 cm, diameter = 3 mm
   (c) length = 50 cm, diameter = 0.5 mm
   (d) length = 100 cm, diameter = 1 mm

(NEET 2013)

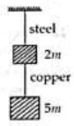
16. The molar specific heats of an ideal gas at constant pressure and volume are denoted by C_p and C_v, respectively. If $\gamma = \frac{C_p}{C_v}$ and R is the universal gas constant, then C_v is equal to

(a) $\frac{(\gamma - 1)}{R}$ (b) γR

(c) $\frac{1+\gamma}{1-\gamma}$ (d) $\frac{R}{(\gamma - 1)}$

(NEET 2013)

17. If the ratio of diameters, lengths and Young's modulus of steel and copper wires shown in the figure are p, q and s respectively, then the corresponding ratio of increase in their lengths would be



(a) $\frac{5q}{(7sp^2)}$ (b) $\frac{7q}{(5sp^2)}$

(c) $\frac{2q}{(5sp)}$ (d) $\frac{7q}{(5sp)}$

(Karnataka NEET 2013)

18. Two metal rods 1 and 2 of same lengths have same temperature difference between their ends. Their thermal conductivities are K_1 and K_2 and cross sectional areas A_1 and A_2, respectively. If the rate of heat conduction in 1 is four times that in 2, then

(a) $K_1A_1 = 4K_2A_2$ (b) $K_1A_1 = 2K_2A_2$
(c) $4K_1A_1 = K_2A_2$ (d) $K_1A_1 = K_2A_2$

(Karnataka NEET 2013)

19. A fluid is in streamline flow across a horizontal pipe of variable area of cross section. For this which of the following statements is correct?
(a) The velocity is maximum at the narrowest part of the pipe and pressure is maximum at the widest part of the pipe.
(b) Velocity and pressure both are maximum at the narrowest part of the pipe.
(c) Velocity and pressure both are maximum at the widest part of the pipe.
(d) The velocity is minimum at the narrowest part of the pipe and the pressure is minimum at the widest part of the pipe.

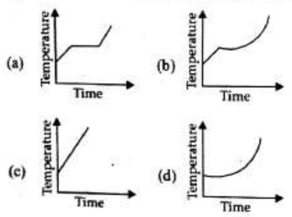
(Karnataka NEET 2013)

20. The density of water at 20°C is 998 kg/m^3 and at 40°C 992 kg/m^3. The coefficient of volume expansion of water is
(a) 3×10^{-4}/°C (b) 2×10^{-4}/°C
(c) 6×10^{-4}/°C (d) 10^{-4}/°C

(Karnataka NEET 2013)

21. If the radius of a star is R and it acts as a black body, what would be the temperature of the star, in which the rate of energy production is Q?
(a) $\dfrac{Q}{4\pi R^2\sigma}$ (b) $\left(\dfrac{Q}{4\pi R^2\sigma}\right)^{-1/2}$
(c) $\left(\dfrac{4\pi R^2 Q}{\sigma}\right)^{1/4}$ (d) $\left(\dfrac{Q}{4\pi R^2\sigma}\right)^{1/4}$
(σ stands for Stefan's constant) *(Prelims 2012)*

22. Liquid oxygen at 50 K is heated to 300 K at constant pressure of 1 atm. The rate of heating is constant. Which one of the following graphs represents the variation of temperature with time?



(Prelims 2012)

23. A slab of stone of area 0.36 m^2 and thickness 0.1 m is exposed on the lower surface to steam at 100°C. A block of ice at 0°C rests on the upper surface of the slab. In one hour 4.8 kg of ice is melted. The thermal conductivity of slab is (Given latent heat of fusion of ice = 3.36×10^5 J kg^{-1})
(a) 1.24 J/m/s/°C (b) 1.29 J/m/s/°C
(c) 2.05 J/m/s/°C (d) 1.02 J/m/s/°C

(Mains 2012)

24. A cylindrical metallic rod in thermal contact with two reservoirs of heat at its two ends conducts an amount of heat Q in time t. The metallic rod is melted and the material is formed into a rod of half the radius of the original rod. What is the amount of heat conducted by the new rod, when placed in thermal contact with the two reservoirs in time t?
(a) $\dfrac{Q}{4}$ (b) $\dfrac{Q}{16}$ (c) $2Q$ (d) $\dfrac{Q}{2}$

(Prelims 2010)

25. The total radiant energy per unit area, normal to the direction of incidence, received at a distance R from the centre of a star of radius r, whose outer surface radiates as a black body at a temperature T K is given by
(a) $\dfrac{\sigma r^2 T^4}{R^2}$ (b) $\dfrac{\sigma r^2 T^4}{4\pi R^2}$
(c) $\dfrac{\sigma r^4 T^4}{R^4}$ (d) $\dfrac{4\pi\sigma r^2 T^4}{R^2}$
(where σ is Stefan's constant) *(Prelims 2010)*

26. Assuming the sun to have a spherical outer surface of radius r, radiating like a black body at temperature t°C, the power received by a unit surface, (normal to the incident rays) at a distance R from the centre of the sun is
(a) $\dfrac{r^2\sigma(t+273)^4}{4\pi R^2}$ (b) $\dfrac{16\pi^2 r^2 \sigma t^4}{R^2}$
(c) $\dfrac{r^2\sigma(t+273)^4}{R^2}$ (d) $\dfrac{4\pi r^2 \sigma t^4}{R^2}$
where σ is the Stefan's constant.
(Prelims 2010, 2007)

27. A black body at 227°C radiates heat at the rate of 7 cals/cm^{2}s. At a temperature of 727°C, the rate of heat radiated in the same units will be

(a) 50 (b) 112
(c) 80 (d) 60 *(Prelims 2009)*

28. The two ends of a rod of length L and a uniform cross-sectional area A are kept at two temperatures T_1 and T_2 ($T_1 > T_2$). The rate of heat transfer, $\dfrac{dQ}{dt}$, through the rod in a steady state is given by
(a) $\dfrac{dQ}{dt} = \dfrac{k(T_1 - T_2)}{LA}$ (b) $\dfrac{dQ}{dt} = kLA(T_1 - T_2)$
(c) $\dfrac{dQ}{dt} = \dfrac{kA(T_1 - T_2)}{L}$ (d) $\dfrac{dQ}{dt} = \dfrac{kL(T_1 - T_2)}{A}$

(Prelims 2009)

29. On a new scale of temperature (which is linear) and called the W scale, the freezing and boiling points of water are 39°W and 239°W respectively. What will be the temperature on the new scale, corresponding to a temperature of 39°C on the Celsius scale ?
(a) 200°W (b) 139°W
(c) 78°W (d) 117°W

(Prelims 2008)

30. A black body is at 727°C. It emits energy at a rate which is proportional to
(a) $(1000)^4$ (b) $(1000)^2$
(c) $(727)^4$ (d) $(727)^2$. *(2007)*

31. A black body at 1227°C emits radiations with maximum intensity at a wavelength of 5000 Å. If the temperature of the body is increased by 1000°C, the maximum intensity will be observed at
(a) 3000 Å (b) 4000 Å
(c) 5000 Å (d) 6000 Å. *(2006)*

32. Which of the following rods, (given radius r and length l) each made of the same material and whose ends are maintained at the same temperature will conduct most heat?
(a) $r = r_0$, $l = l_0$ (b) $r = 2r_0$, $l = l_0$
(c) $r = r_0$, $l = 2l_0$ (d) $r = 2r_0$, $l = 2l_0$.

(2005)

33. If λ_m denotes the wavelength at which the radiative emission from a black body at a temperature T K is maximum, then
(a) $\lambda_m \propto T^4$ (b) λ_m is independent of T
(c) $\lambda_m \propto T$ (d) $\lambda_m \propto T^{-1}$ *(2004)*

34. Consider a compound slab consisting of two different materials having equal thicknesses and thermal conductivities K and $2K$, respectively. The equivalent thermal conductivity of the slab is
(a) $\frac{2}{3}K$ (b) $\sqrt{2}\,K$
(c) $3K$ (d) $\frac{4}{3}K$ *(2003)*

35. Unit of Stefan's constant is
(a) watt m^2 K^4 (b) watt m^2/K^4
(c) watt/m^2 K (d) watt/m^{2}K^4. *(2002)*

36. Consider two rods of same length and different specific heats (S_1, S_2), conductivities (K_1, K_2) and area of cross-sections (A_1, A_2) and both having temperatures T_1 and T_2 at their ends. If rate of loss of heat due to conduction is equal, then
(a) $K_1A_1 = K_2A_2$ (b) $\dfrac{K_1A_1}{S_1} = \dfrac{K_2A_2}{S_2}$
(c) $K_2A_1 = K_1A_2$ (d) $\dfrac{K_2A_1}{S_2} = \dfrac{K_1A_2}{S_1}$.

(2002)

37. For a black body at temperature 727°C, its radiating power is 60 watt and temperature of surrounding is 227°C. If temperature of black body is changed to 1227°C then its radiating power will be
(a) 304 W (b) 320 W
(c) 240 W (d) 120 W. *(2002)*

38. Which of the following is best close to an ideal black body?
(a) black lamp
(b) cavity maintained at constant temperature
(c) platinum black
(d) a lump of charcoal heated to high temperature.

(2002)

39. The Wien's displacement law express relation between
(a) wavelength corresponding to maximum energy and temperature
(b) radiation energy and wavelength
(c) temperature and wavelength
(d) colour of light and temperature. *(2002)*

40. A cylindrical rod having temperature T_1 and T_2 at its end. The rate of flow of heat Q_1 cal/sec. If all the linear dimension are doubled keeping temperature constant, then rate of flow of heat Q_2 will be
(a) $4Q_1$ (b) $2Q_1$
(c) $\frac{Q_1}{4}$ (d) $\frac{Q_1}{2}$. *(2001)*

41. A black body has maximum wavelength 1 m at 2000 K. Its corresponding wavelength at 3000 K will be
(a) $\frac{3}{2}\lambda$ m (b) $\frac{2}{3}\lambda$ m
(c) $\frac{16}{81}\lambda$ m (d) $\frac{81}{16}\lambda$ m. *(2000)*

42. A black body is at a temperature of 500 K. It emits energy at a rate which is proportional to
(a) $(500)^3$ (b) $(500)^4$
(c) 500 (d) $(500)^2$. *(1997)*

43. A beaker full of hot water is kept in a room. If it cools from 80°C to 75°C in t_1 minutes, from 75°C to 70°C in t_2 minutes and from 70°C to 65°C in t_3 minutes, then
(a) $t_1 < t_2 < t_3$ (b) $t_1 > t_2 > t_3$
(c) $t_1 = t_2 = t_3$ (d) $t_1 < t_2 = t_3$. *(1995)*

44. Heat is flowing through two cylindrical rods of the same material. The diameters of the rods are in the ratio 1 : 2 and the lengths in the ratio 2 : 1. If the temperature difference between the ends is same, then ratio of the rate of flow of heat through them will be
(a) 2 : 1 (b) 8 : 1
(c) 1 : 1 (d) 1 : 8. *(1995)*

45. If the temperature of the sun is doubled, the rate of energy recieved on earth will be increased by a factor of
(a) 2 (b) 4
(c) 8 (d) 16 *(1993)*

46. Mercury thermometer can be used to measure temperature upto
(a) 260°C (b) 100°C
(c) 360°C (d) 500°C *(1992)*

47. A Centigrade and a Fahrenheit thermometer are dipped in boiling water. The water temperature is lowered until the Fahrenheit thermometer registers 140°F. What is the fall in temperature as registered by the centigrade thermometer ?
(a) 80°C (b) 60°C
(c) 40°C (d) 30°C *(1990)*

EXPLANATIONS

1. (d) : Let the speed of the ejection of the liquid through the holes be v. Then according to the equation of continuity,

$\pi R^2 V = n\pi r^2 v$ or $v = \frac{\pi R^2 V}{n\pi r^2} = \frac{VR^2}{nr^2}$

2. (d) : Water will not overflow but will change its radius of curvature.

3. (d) : Let ρ_0 and ρ_T be densities of glycerin at 0°C and T°C respectively. Then,
$\rho_T = \rho_0(1 - \gamma\Delta T)$
where γ is the coefficient of volume expansion of glycerine and ΔT is rise in temperature.

$\frac{\rho_T}{\rho_0} = 1 - \gamma\Delta T$ or $\gamma\Delta T = 1 - \frac{\rho_T}{\rho_0}$

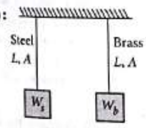
Thus, $\frac{\rho_0 - \rho_T}{\rho_0} = \gamma\Delta T$

Here, $\gamma = 5 \times 10^{-4}\ \text{K}^{-1}$ and $\Delta T = 40°\text{C} = 40$ K

∴ The fractional change in the density of glycerin

$= \frac{\rho_0 - \rho_T}{\rho_0} = \gamma\Delta T = (5 \times 10^{-4}\ \text{K}^{-1})(40\ \text{K}) = 0.020$

4. (d):



Let L and A be length and area of cross section of each wire. In order to have the lower ends of the wires to be at the same level (*i.e.* same elongation is produced in both wires), let weights W_s and W_b are added to steel and brass wires respectively. Then

By definition of Young's modulus, the elongation produced in the steel wire is

$\Delta L_s = \frac{W_s L}{Y_s A}$ $\left(\text{as } Y = \frac{W/A}{\Delta L/L}\right)$

and that in the brass wire is

$\Delta L_b = \frac{W_b L}{Y_b A}$

But $\Delta L_s = \Delta L_b$ (given)

∴ $\frac{W_s L}{Y_s A} = \frac{W_b L}{Y_b A}$ or $\frac{W_s}{W_b} = \frac{Y_s}{Y_b}$

As $\frac{Y_s}{Y_b} = 2$ (given)

∴ $\frac{W_s}{W_b} = \frac{2}{1}$

5. (b) 6. (a)

7. (d) : According to Wein's displacement law
$\lambda_m T$ = constant ...(i)
For star P, intensity of violet colour is maximum
For star Q, intensity of red colour is maximum.
For star R, intensity of green colour is maximum.
Also, $\lambda_r > \lambda_g > \lambda_v$
Using equation (i), $T_r < T_g < T_v$
$T_Q < T_R < T_P$

8. (a) : Depth of ocean $d = 2700$ m
Density of water, $\rho = 10^3$ kg m^{-3}
Compressibility of water, $K = 45.4 \times 10^{-11}$ Pa^{-1}

$\frac{\Delta V}{V} = ?$

Excess pressure at the bottom, $\Delta P = \rho g d$
$= 10^3 \times 10 \times 2700 = 27 \times 10^6$ Pa

We know, $B = \frac{\Delta P}{(\Delta V/V)}$

$\left(\frac{\Delta V}{V}\right) = \frac{\Delta P}{B} = K.\Delta P$ $\left(\because K = \frac{1}{B}\right)$

$= 45.4 \times 10^{-11} \times 27 \times 10^6 = 1.2 \times 10^{-2}$

9. (b) : As $V = Al$ ... (i)
where A is the area of cross-section of the wire.

Young's modulus, $Y = \frac{(F/A)}{(\Delta l/l)} = \frac{Fl}{A\Delta l}$

$\Delta l = \frac{Fl}{YA} = \frac{Fl^2}{YV}$ (Using (i))

$\Delta l \propto l^2$

Hence, the graph between Δl and l^2 is a straight line.

10. (c) : Let n droplets each of radius r coalesce to form a big drop of radius R.

$\therefore$ Volume of n droplets = Volume of big drop

$$n \times \frac{4}{3}\pi r^3 = \frac{4}{3}\pi R^3$$

$$n = \frac{R^3}{r^3} \quad \text{...(i)}$$

Volume of big drop, $V = \frac{4}{3}\pi R^3$ ...(ii)

Initial surface area of n droplets,

$$A_i = n \times 4\pi r^2 = \frac{R^3}{r^3} \times 4\pi r^2 \quad \text{(Using (i))}$$

$$= 4\pi \frac{R^3}{r} = \left(\frac{4}{3}\pi R^3\right)\frac{3}{r}$$

$$= \frac{3V}{r} \quad \text{(Using (ii))}$$

Final surface area of big drop

$$A_f = 4\pi R^2 = \left(\frac{4}{3}\pi R^3\right)\frac{3}{R} = \frac{3V}{R} \quad \text{(Using (ii))}$$

Decrease in surface area

$$\Delta A = A_i - A_f = \frac{3V}{r} - \frac{3V}{R} = 3V\left(\frac{1}{r} - \frac{1}{R}\right)$$

$\therefore$ Energy released = Surface tension × Decrease in surface area

$$= T \times \Delta A$$

$$= 3VT\left(\frac{1}{r} - \frac{1}{R}\right)$$

11. **(d) :** Here,

Specific heat of water, $s_w = 1$ cal g^{-1} °C^{-1}

Latent heat of steam, $L_s = 540$ cal g^{-1}

Heat lost by m g of steam at 100°C to change into water at 80°C is

$$Q_1 = mL_s + ms_w\Delta T_w$$
$$= m \times 540 + m \times 1 \times (100 - 80)$$
$$= 540m + 20m = 560m$$

Heat gained by 20 g of water to change its temperature from 10°C to 80°C is

$$Q_2 = m_w s_w \Delta T_w = 20 \times 1 \times (80 - 10) = 1400$$

According to principle of calorimetry

$$Q_1 = Q_2$$

$\therefore$ $560m = 1400$ or $m = 2.5$ g

Total mass of water present

$$= (20 + m)\text{ g} = (20 + 2.5)\text{ g} = 22.5\text{ g}$$

12. **(a) :** Let T_s be the temperature of the surroundings.

According to Newton's law of cooling

$$\frac{T_1 - T_2}{t} = K\left(\frac{T_1 + T_2}{2} - T_s\right)$$

For first 5 minutes,

$T_1 = 70$°C, $T_2 = 60$°C, $t = 5$ minutes

$$\therefore \quad \frac{70-60}{5} = K\left(\frac{70+60}{2} - T_s\right)$$

$$\frac{10}{5} = K(65 - T_s) \quad \text{...(i)}$$

For next 5 minutes,

$T_1 = 60$°C, $T_2 = 54$°C, $t = 5$ minutes

$$\therefore \quad \frac{60-54}{5} = K\left(\frac{60+54}{2} - T_s\right)$$

$$\frac{6}{5} = K(57 - T_s) \quad \text{...(ii)}$$

Divide eqn. (i) by eqn. (ii), we get

$$\frac{5}{3} = \frac{65 - T_s}{57 - T_s}$$

$$285 - 5T_s = 195 - 3T_s$$

$$2T_s = 90 \text{ or } T_s = 45°\text{C}$$

13. **(d) :** According to Wien's displacement law

$$\lambda_m T = \text{constant}$$

$$\lambda_m = \frac{\text{constant}}{T}$$

So when a piece of iron is heated, λ_m decrease *i.e.* with rise in temperature the maximum intensity of radiation emitted gets shifted towards the shorter wavelengths. So the colour of the heated object will change that of longer wavelength (red) to that of shorter (reddish yellow) and when the temperature is sufficiently high and all wavelengths are emitted, the colour will become white.

14. **(b) :** The wettability of a surface by a liquid depends primarily on angle of contact between the surface and the liquid.

15. **(c) :** Young's modulus, $Y = \frac{FL}{A\Delta L} = \frac{4FL}{\pi D^2 \Delta L}$

or $\Delta L = \frac{4FL}{\pi D^2 Y}$

where F is the force applied, L is the length, D is the diameter and ΔL is the extension of the wire respectively.

As each wire is made up of same material therefore their Young's modulus is same for each wire.

For all the four wires, $Y, F(=\text{tension})$ are the same.

$$\therefore \quad \Delta L \propto \frac{L}{D^2}$$

In (a) $\frac{L}{D^2} = \frac{200\text{ cm}}{(0.2\text{ cm})^2} = 5 \times 10^3\text{ cm}^{-1}$

In (b) $\frac{L}{D^2} = \frac{300\text{ cm}}{(0.3\text{ cm})^2} = 3.3 \times 10^3\text{ cm}^{-1}$

In (c) $\frac{L}{D^2} = \frac{50\text{ cm}}{(0.05\text{ cm})^2} = 20 \times 10^3\text{ cm}^{-1}$

In (d) $\frac{L}{D^2} = \frac{100\text{ cm}}{(0.1\text{ cm})^2} = 10 \times 10^3\text{ cm}^{-1}$

Hence, ΔL is maximum in (c).

16. **(d) :** For an ideal gas

$$C_p - C_v = R \quad \text{...(i)}$$

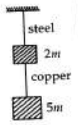
Divide C_v on both sides, we get

$$\frac{C_p}{C_v} - 1 = \frac{R}{C_v}$$

As $\gamma = \frac{C_p}{C_v}$ $\therefore$ $\gamma - 1 = \frac{R}{C_v}$

$$C_v = \frac{R}{\gamma - 1}$$

17. **(b) :** As $Y = \frac{FL}{A\Delta L} = \frac{4FL}{\pi D^2 \Delta L}$



$$\Delta L = \frac{4FL}{\pi D^2 Y}$$

$$\therefore \quad \frac{\Delta L_S}{\Delta L_C} = \frac{F_S}{F_C}\frac{L_S}{L_C}\frac{D_C^2}{D_S^2}\frac{Y_C}{Y_S}$$

where subscripts S and C refer to copper and steel respectively.

Here,

$$F_s = (5m + 2m)g = 7mg$$
$$F_C = 5mg$$
$$\frac{L_S}{L_C} = q, \frac{D_S}{D_C} = p, \frac{Y_S}{Y_C} = s$$

$$\therefore \quad \frac{\Delta L_S}{\Delta L_C} = \left(\frac{7mg}{5mg}\right)(q)\left(\frac{1}{p}\right)^2\left(\frac{1}{s}\right) = \frac{7q}{5p^2 s}$$

18. **(a) :** Let L be length of each rod.

Rate of heat flow in rod 1 for the temperature difference ΔT is

$$H_1 = \frac{K_1 A_1 \Delta T}{L}$$

Rate of heat flow in rod 2 for the same difference ΔT is

$$H_2 = \frac{K_2 A_2 \Delta T}{L}$$

As per question

$$H_1 = 4H_2$$

$$\frac{K_1 A_1 \Delta T}{L} = 4\frac{K_2 A_2 \Delta T}{L}$$

$$K_1 A_1 = 4K_2 A_2$$

19. **(a) :** According to equation of continuity,

$$Av = \text{constant}$$

Therefore, velocity is maximum at the narrowest part and minimum at the widest part of the pipe. According to Bernoulli's theorem for a horizontal pipe,

$$P + \frac{1}{2}\rho v^2 = \text{constant}$$

Hence, when a fluid flow across a horizontal pipe of variable area of cross-section its velocity is maximum and pressure is minimum at the narrowest part and vice versa.

20. **(a) :** As $\rho_{T_2} = \frac{\rho_{T_1}}{(1+\gamma\Delta T)} = \frac{\rho_{T_1}}{1+\gamma(T_2 - T_1)}$

Here, $T_1 = 20$°C, $T_2 = 40$°C

$\rho_{20} = 998$ kg/m^3, $\rho_{40} = 992$ kg/m^3

$$\therefore \quad 992 = \frac{998}{1 + \gamma(40-20)}$$

$$992 = \frac{998}{1 + 20\gamma}$$

$$992(1 + 20\gamma) = 998$$

$$1 + 20\gamma = \frac{998}{992} \text{ or } 20\gamma = \frac{998}{992} - 1 = \frac{6}{992}$$

$$\gamma = \frac{6}{992} \times \frac{1}{20} = 3 \times 10^{-4}/°\text{C}$$

21. **(d) :** According to Stefan's law, $Q = \sigma AT^4$

or $T = \left(\frac{Q}{\sigma A}\right)^{1/4} = \left(\frac{Q}{\sigma 4\pi R^2}\right)^{1/4}$

22. **(a) :** Temperature of liquid oxygen will first increase in the same phase. Then, the liquid oxygen will change to gaseous phase during which temperature will remain constant. After that temperature of oxygen in gaseous state will increase. Hence option (a) represents corresponding temperature-time graph.

23. **(a) :** 
Heat flows through the slab in t s is

$$Q=\frac{KA(T_1-T_2)t}{L}=\frac{K\times 0.36\times(100-0)\times 3600}{0.1}$$

$$=\frac{K\times 0.36\times 100\times 3600}{0.1} \qquad ...(i)$$

So ice melted by this heat is

$$m_{ice}=\frac{Q}{L_f} \qquad ...(ii)$$

or $Q=m_{ice}L_f=4.8\times 3.36\times 10^5$

From (i) and (ii), we get

$$\frac{K\times 0.36\times(100-0)\times 3600}{0.1}=4.8\times 3.36\times 10^5$$

$$K=\frac{4.8\times 3.36\times 10^5\times 0.1}{0.36\times 100\times 3600}=1.24\ \text{J/m/s/°C}$$

24. **(b) :** The amount of heat flows in time t through a cylindrical metallic rod of length L and uniform area of cross-section $A(=\pi R^2)$ with its ends maintained at temperatures T_1 and T_2 $(T_1 > T_2)$ is given by

$$Q=\frac{KA(T_1-T_2)t}{L} \qquad ...(i)$$

where K is the thermal conductivity of the material of the rod.

Area of cross-section of new rod

$$A'=\pi\left(\frac{R}{2}\right)^2=\frac{\pi R^2}{4}=\frac{A}{4} \qquad ...(ii)$$

As the volume of the rod remains unchanged

$\therefore \quad AL=A'L'$

where L' is the length the new rod

or $\quad L'=L\dfrac{A}{A'} \qquad ...(iii)$

$\quad =4L \qquad$ (Using (ii))

Now, the amount of heat flows in same time t in the new rod with its ends maintained at the same temperatures T_1 and T_2 is given by

$$Q'=\frac{KA'(T_1-T_2)t}{L'} \qquad ...(iv)$$

Substituting the values of A' and L' from equations (ii) and (iii) in the above equation, we get

$$Q'=\frac{K(A/4)(T_1-T_2)t}{4L}=\frac{1}{16}\frac{KA(T_1-T_2)t}{L}$$

$$=\frac{1}{16}Q \qquad \text{(Using ...}$$

25. **(a) :** According to the Stefan Boltzmann law, power radiated by the star whose outer surface radiates as a black body at temperature T K is given by

$$P=\sigma 4\pi r^2 T^4$$

where,

r = radius of the star

σ = Stefan's constant

The radiant power per unit area received at distance R from the centre of a star is

$$S=\frac{P}{4\pi R^2}=\frac{\sigma 4\pi r^2 T^4}{4\pi R^2}=\frac{\sigma r^2 T^4}{R^2}$$

26. **(c) :** Power P radiated by the sun with its surface temperature $(t+273)$ K is given by Stefan Boltzmann law.

$$P=\sigma e\,4\pi r^2(t+273)^4$$

where r is the radius of the sun and the sun treated as a black body where $e=1$.

The radiant power per unit area received by a surface at a distance R from the centre of the sun is given by

$$S=\frac{P}{4\pi R^2}=\frac{\sigma 4\pi r^2(t+273)^4}{4\pi R^2}=\frac{r^2\sigma(t+273)^4}{R^2}$$

27. **(b) :** Rate of heat radiated at $(227+273)$ K $= 7$ cals/(cm²s)

Let rate of heat radiated at $(727+273)$ K $= x$ cals/(cm²s)

By Stefan's law, $7\propto(500)^4$ and $x\propto(1000)^4$

$$\therefore \frac{x}{7}=2^4 \Rightarrow x=7\times 2^4=112\ \text{cals/(cm}^2\text{s)}$$

28. **(c) :** Similar to $I=V/R$ 

$$\frac{dQ}{dt}=\frac{kA}{L}(T_1-T_2)$$

k = conductivity of the rod.

29. **(d) :** 
$$\therefore \quad 39°\text{C}=39\times 2+39=(78+39)°\ \text{W}$$

$$=117°\ \text{W}.$$

30. **(a) :** According to Stefan's law, rate of energy radiated $E\propto T^4$ where T is the absolute temperature of a black body.

$\therefore \quad E\propto(727+273)^4$ or $E\propto[1000]^4$.

31. **(a) :** According to Wein's displacement law, $\lambda_{max}T$ = constant

$$\therefore \quad \frac{\lambda_{max_1}}{\lambda_{max_2}}=\frac{T_2}{T_1}$$

$$\text{or,} \quad \lambda_{max_2}=\frac{\lambda_{max_1}\times T_1}{T_2}=\frac{5000\times 1500}{2500}=3000\ \text{Å}.$$

32. **(b) :** Heat conducted

$$=\frac{KA(T_1-T_2)t}{l}=\frac{K\pi r^2(T_1-T_2)t}{l}$$

The rod with the maximum ratio of A/l will conduct most. Here the rod with $r=2r_0$ and $l=l_0$ will conduct most.

33. **(d) :** $\lambda_m T$ = constant, $\lambda_m\propto T^{-1}$ (Wein's displacement law)

34. **(a) :** The slabs are in series.

Total resistance $R=R_1+R_2$

$$\Rightarrow \frac{l}{AK_{effective}}=\frac{l}{A.K}+\frac{l}{A2K}$$

$$\Rightarrow \frac{1}{K_{effective}}=\frac{1}{K}+\frac{1}{2K}=\frac{3}{2K} \qquad \therefore K_{effective}=\frac{2K}{3}$$

35. **(d) :** Unit of Stefan's constant is watt/m²K⁴.

36. **(a) :** 
Rate of heat loss in rod 1 $=Q_1=\dfrac{K_1A_1(T_1-T_2)}{l_1}$

Rate of heat loss in rod 2 $=Q_2=\dfrac{K_2A_2(T_1-T_2)}{l_2}$

By problem, $Q_1=Q_2$.

$$\therefore \quad \frac{K_1A_1(T_1-T_2)}{l_1}=\frac{K_2A_2(T_1-T_2)}{l_2}.$$

$\therefore \quad K_1A_1=K_2A_2. \qquad [\because l_1=l_2]$

37. **(b) :** Radiating power of a black body

$$=E_0=\sigma(T^4-T_0^4)A$$

where σ is known as the Stefan-Boltzmann constant, A is the surface area of a black body, T is the temperature of the black body and T_0 is the temperature of the surrounding.

$\therefore \quad 60=\sigma(1000^4-500^4) \qquad ...(i)$

$[T=727°\text{C}=727+273=1000\ \text{K},$

$T_0=227°\text{C}=500\ \text{K}].$

In the second case, $T=1227°\text{C}=1500$ K and let E' be the radiating power.

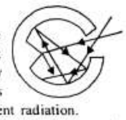
$\therefore \quad E'=\sigma(1500^4-500^4) \qquad ...(ii)$

From (i) and (ii) we have

$$\frac{E'}{60}=\frac{1500^4-500^4}{1000^4-500^4}=\frac{15^4-5^4}{10^4-5^4}=\frac{50000}{9375}$$

$$\therefore \quad E'=\frac{50000}{9375}\times 60=320\ \text{W}.$$

38. **(b) :** An ideal black body is one which absorbs all the incident radiation without reflecting or transmitting any part of it. Black lamp absorbs approximately 96% of incident radiation.



An ideal black body can be realized in practice by a small hole in the wall of a hollow body (as shown in figure) which is at uniform temperature. Any radiation entering the hollow body through the holes suffers a number of reflections and ultimately gets completely absorbed. This can be facilitated by coating the interior surface with black so that about 96% of the radiation is absorbed at each reflection. The portion of the interior surface opposite to the hole is made conical to avoid the escape of the reflected ray after one reflection.

39. **(a) :** Wien's displacement law states that the product of absolute temperature and the wavelength at which the emissive power is maximum is constant *i.e.* $\lambda_{max}T$ = constant. Therefore it expresses relation between wavelength corresponding to maximum energy and temperature.

40. **(b) :** Heat flow rate $\dfrac{dQ}{dt}=\dfrac{KA(T_1-T_2)}{L}=Q$

When linear dimensions are double.

$A_1\propto r_1^2,\ L_1=L$

$A_2\propto 4r_1^2,\ L_2=2L$ so $Q_2=2Q_1$.

41. **(b) :** According to Wein's law,

$\lambda_m T$ = constant.

$\therefore \quad \lambda'=(2/3)\lambda_m$

42. (b) : Temperature of black body $(T) = 500$ K. Therefore total energy emitted by the black body $(E) \propto T^4 \propto (500)^4$.

43. (a) : The rate of cooling is directly proportional to the temperature difference of the body and the surroundings. So, cooling will be fastest in the first case and slowest in the third case.

44. (d) : Ratio of diameters of rod = 1 : 2 and ratio of their lengths 2 : 1.

The rate of flow of heat, $(R) = \frac{KA\Delta T}{l} \propto \frac{A}{l}$.

Therefore $\frac{R_1}{R_2} = \frac{A_1}{A_2} \times \frac{l_2}{l_1} = \left(\frac{1}{2}\right)^2 \times \frac{1}{2} = \frac{1}{8}$

or $R_1 : R_2 = 1 : 8$

45. (d) : Amount of energy radiated $\propto T^4$.

46. (c) : Mercury thermometer is based on the principle of change of volume with rise of temperature and can measure temperatures ranging from –30°C to 357°C

47. (c) : Using $\frac{F-32}{180} = \frac{C}{100}$, temperature of boiling water = 100°C $\Rightarrow \frac{140-32}{180} = \frac{C}{100} \Rightarrow C = 60$
we get, fall in temperature = 40°C

CHAPTER 9

Thermodynamics and Kinetic Theory

1. An ideal gas is compressed to half its initial volume by means of several processes. Which of the process results in the maximum work done on the gas?
(a) Isochoric
(b) Isothermal
(c) Adiabatic
(d) Isobaric
(AIPMT 2015)

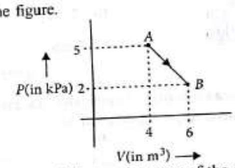
2. Two vessels separately contain two ideal gases A and B at the same temperature, the pressure of A being twice that of B. Under such conditions, the density of A is found to be 1.5 times the density of B. The ratio of molecular weight of A and B is
(a) 2
(b) $\frac{1}{2}$
(c) $\frac{2}{3}$
(d) $\frac{3}{4}$
(AIPMT 2015)

3. The coefficient of performance of a refrigerator is 5. If the temperature inside freezer is –20°C, the temperature of the surroundings to which it rejects heat is
(a) 11°C
(b) 21°C
(c) 31°C
(d) 41°C
(AIPMT 2015)

4. The ratio of the specific heats $\frac{C_p}{C_v} = \gamma$ in terms of degrees of freedom (n) is given by
(a) $\left(1+\frac{2}{n}\right)$
(b) $\left(1+\frac{n}{2}\right)$
(c) $\left(1+\frac{1}{n}\right)$
(d) $\left(1+\frac{n}{3}\right)$
(AIPMT 2015, Cancelled)

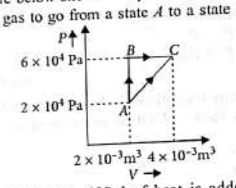
5. A Carnot engine, having an efficiency of as heat engine, is used as a refrigerator. If the work done on the system is 10 J, the amount of energy absorbed from the reservoir at lower temperature is
(a) 90 J
(b) 1 J
(c) 100 J
(d) 99 J
(AIPMT 2015, Cancelled)

6. One mole of an ideal diatomic gas undergoes a transition from A to B along a path AB as shown in the figure.



The change in internal energy of the gas during the transition is
(a) 20 J
(b) –12 kJ
(c) 20 kJ
(d) –20 kJ
(AIPMT 2015, Cancelled)

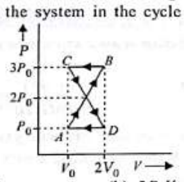
7. Figure below shows two paths that may be taken by a gas to go from a state A to a state C.



In process AB, 400 J of heat is added to the system and in process BC, 100 J of heat is added to the system. The heat absorbed by the system in the process AC will be
(a) 460 J
(b) 300 J
(c) 380 J
(d) 500 J
(AIPMT 2015, Cancelled)

8. A monoatomic gas at a pressure P, having a volume V expands isothermally to a volume $2V$ and then adiabatically to a volume $16V$. The final pressure of the gas is (Take $\gamma = 5/3$)
(a) $64P$ (b) $32P$ (c) $P/64$ (d) $16P$
(AIPMT 2014)

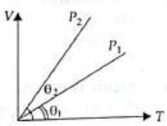
9. A thermodynamic system undergoes cyclic process $ABCDA$ as shown in figure. The work done by the system in the cycle is



(a) P_0V_0 (b) $2P_0V_0$
(c) $\frac{P_0V_0}{2}$ (d) zero
(AIPMT 2014)

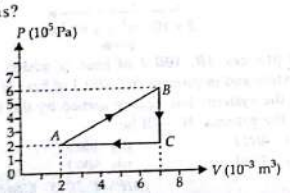
10. The mean free path of molecules of a gas, (radius r) is inversely proportional to
(a) r^3 (b) r^2
(c) r (d) $\sqrt{r}$
(AIPMT 2014)

11. In the given $(V-T)$ diagram, what is the relation between pressures P_1 and P_2?



(a) $P_2 < P_1$
(b) Cannot be predicted
(c) $P_2 = P_1$
(d) $P_2 > P_1$
(NEET 2013)

12. A gas is taken through the cycle $A \rightarrow B \rightarrow C \rightarrow A$, as shown. What is the net work done by the gas?

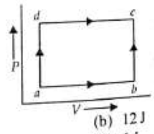


(a) Zero (b) -2000 J
(c) 2000 J (d) 1000 J *(NEET 2013)*

13. During an adiabatic process, the pressure of a gas is found to be proportional to the cube of its temperature. The ratio of $\frac{C_p}{C_v}$ for the gas is
(a) $\frac{5}{3}$ (b) $\frac{3}{2}$
(c) $\frac{4}{3}$ (d) 2 *(NEET 2013)*

14. The amount of heat energy required to raise the temperature of 1 g of Helium at NTP, from T_1 K to T_2 K is
(a) $\frac{3}{4}N_a k_B(T_2-T_1)$ (b) $\frac{3}{4}N_a k_B\left(\frac{T_2}{T_1}\right)$
(c) $\frac{3}{8}N_a k_B(T_2-T_1)$ (d) $\frac{3}{2}N_a k_B(T_2-T_1)$
(NEET 2013)

15. A system is taken from state a to state c by two paths adc and abc as shown in the figure. The internal energy at a is $U_a = 10$ J. Along the path adc the amount of heat heat absorbed $dQ_1 = 50$ J and the work obtained $dW_1 = 20$ J whereas along the path abc the heat absorbed $dQ_2 = 36$ J. The amount of work along the path abc is



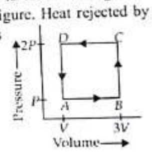
(a) 10 J (b) 12 J
(c) 36 J (d) 6 J
(Karnataka NEET 2013)

16. Which of the following relations does not give the equation of an adiabatic process, where terms have their usual meaning?
(a) $P^{1-\gamma}T^{\gamma}$ = constant
(b) PV^{γ} = constant
(c) $TV^{\gamma-1}$ = constant
(d) $P^{\gamma}T^{1-\gamma}$ = constant
(Karnataka NEET 2013)

17. Two Carnot engines A and B are operated in series. The engine A receives heat from the source at temperature T_1 and rejects the heat to the sink at temperature T. The second engine B receives the heat at temperature T and rejects to its sink at temperature T_2. For what value of T the efficiencies of the two engines are equal
(a) $\frac{T_1-T_2}{2}$ (b) T_1T_2
(c) $\sqrt{T_1T_2}$ (d) $\frac{T_1+T_2}{2}$
(Karnataka NEET 2013)

18. In a vessel, the gas is at pressure P. If the mass of all the molecules is halved and their speed is doubled, then the resultant pressure will be
(a) $2P$ (b) P
(c) $P/2$ (d) $4P$
(Karnataka NEET 2013)

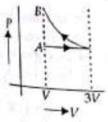
19. A thermodynamic system is taken through the cycle $ABCD$ as shown in figure. Heat rejected by the gas during the cycle is



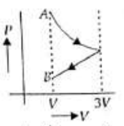
(a) $2PV$
(b) $4PV$
(c) $\frac{1}{2}PV$
(d) PV
(Prelims 2012)

20. One mole of an ideal gas goes from an initial state A to final state B via two processes : It first undergoes isothermal expansion from volume V to $3V$ and then its volume is reduced from $3V$ to V at constant pressure. The correct P-V diagram representing the two processes is

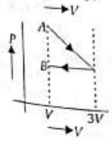
(a)



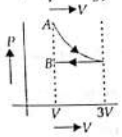
(b)



(c)

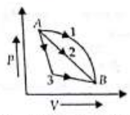


(d)



(Prelims 2012)

21. An ideal gas goes from state A to state B via three different processes as indicated in the P-V diagram.



If Q_1, Q_2, Q_3 indicate the heat absorbed by the gas along the three processes and ΔU_1, ΔU_2, ΔU_3 indicate the change in internal energy along the three processes respectively, then
(a) $Q_1 > Q_2 > Q_3$ and $\Delta U_1 = \Delta U_2 = \Delta U_3$
(b) $Q_3 > Q_2 > Q_1$ and $\Delta U_1 = \Delta U_2 = \Delta U_3$
(c) $Q_1 = Q_2 = Q_3$ and $\Delta U_1 > \Delta U_2 > \Delta U_3$
(d) $Q_3 > Q_2 > Q_1$ and $\Delta U_1 > \Delta U_2 > \Delta U_3$
(Mains 2012)

22. During an isothermal expansion, a confined ideal gas does -150 J of work against its surroundings. This implies that
(a) 150 J of heat has been removed from the gas
(b) 300 J of heat has been added to the gas
(c) no heat is transferred because the process is isothermal
(d) 150 J of heat has been added to the gas
(Prelims 2011)

23. When 1 kg of ice at 0°C melts to water at 0°C, the resulting change in its entropy, taking latent heat of ice to be 80 cal/°C, is
(a) 273 cal/K (b) 8×10^4 cal/K
(c) 80 cal/K (d) 293 cal/K
(Prelims 2011)

24. A mass of diatomic gas ($\gamma = 1.4$) at a pressure of 2 atmospheres is compressed adiabatically so that its temperature rises from 27°C to 927°C. The pressure of the gas in the final state is
(a) 8 atm (b) 28 atm
(c) 68.7 atm (d) 256 atm
(Mains 2011)

25. If ΔU and ΔW represent the increase in internal energy and work done by the system respectively in a thermodynamical process, which of the following is true?
(a) $\Delta U = -\Delta W$, in a adiabatic process
(b) $\Delta U = \Delta W$, in a isothermal process
(c) $\Delta U = \Delta W$, in a adiabatic process
(d) $\Delta U = -\Delta W$, in a isothermal process
(Prelims 2010)

26. If c_p and c_v denote the specific heats (per unit mass of an ideal gas of molecular weight M, then
(a) $c_p - c_v = R/M^2$ (b) $c_p - c_v = R$
(c) $c_p - c_v = R/M$ (d) $c_p - c_v = MR$
where R is the molar gas constant.
(Mains 2010)

27. A monoatomic gas at pressure P_1 and volume V_1 is compressed adiabatically to $\frac{1}{8}$th of its original volume. What is the final pressure of the gas?
(a) $64P_1$ (b) P_1
(c) $16P_1$ (d) $32P_1$ *(Mains 2010)*

28. The internal energy change in a system that has absorbed 2 kcal of heat and done 500 J of work is
(a) 6400 J (b) 5400 J
(c) 7900 J (d) 8900 J
(Prelims 2009)

29. In thermodynamic processes which of the following statements is not true?
(a) In an isochoric process pressure remains constant.
(b) In an isothermal process the temperature remains constant.
(c) In an adiabatic process PV^{γ} = constant.
(d) In an adiabatic process the system is insulated from the surroundings.
(Prelims 2009)

30. At 10°C the value of the density of a fixed mass of an ideal gas divided by it pressure is x. At 110°C this ratio is
(a) $\frac{10}{110}x$ (b) $\frac{283}{383}x$
(c) x (d) $\frac{383}{283}x$
(Prelims 2008)

31. If Q, E and W denote respectively the heat added, change in internal energy and the work done in a closed cycle process, then
(a) $E = 0$ (b) $Q = 0$
(c) $W = 0$ (d) $Q = W = 0$
(Prelims 2008)

32. An engine has an efficiency of 1/6. When the temperature of sink is reduced by 62°C, its efficiency is doubled. Temperatures of the source is
(a) 37°C (b) 62°C
(c) 99°C (d) 124°C. *(2007)*

33. A Carnot engine whose sink is at 300 K has an efficiency of 40%. By how much should the temperature of source be increased so as to increase its efficiency by 50% of original efficiency?
(a) 380 K (b) 275 K
(c) 325 K (d) 250 K.
(2006)

34. The molar specific heat at constant pressure of an ideal gas is (7/2)R. The ratio of specific heat at constant pressure to that at constant volume is
(a) 9/7 (b) 7/5
(c) 8/7 (d) 5/7.
(2006)

35. An ideal gas heat engine operates in Carnot cycle between 227°C and 127°C. It absorbs 6×10^4 cal of heat at higher temperature. Amount of heat converted to work is
(a) 4.8×10^4 cal (b) 6×10^4 cal
(c) 2.4×10^4 cal (d) 1.2×10^4 cal.
(2005)

36. Which of the following processes is reversible?
(a) Transfer of heat by conduction
(b) Transfer of heat by radiation
(c) Isothermal compression
(d) Electrical heating of a nichrome wire.
(2005)

37. The equation of state for 5 g of oxygen at a pressure P and temperature T, when occupying a volume V, will be
(a) $PV = (5/32)RT$ (b) $PV = 5RT$
(c) $PV = (5/2)RT$ (d) $PV = (5/16)RT$
(where R is the gas constant)
(2004)

38. One mole of an ideal gas at an initial temperature of T K does $6R$ joule of work adiabatically. If the ratio of specific heats of this gas at constant pressure and at constant volume is 5/3, the final temperature of gas will be
(a) $(T + 2.4)$ K (b) $(T - 2.4)$ K
(c) $(T + 4)$ K (d) $(T - 4)$ K *(2004)*

39. An ideal gas heat engine operates in a Carnot cycle between 227°C and 127°C. It absorbs 6 kcal at the higher temperature. The amount of heat (in kcal) converted into work is equal to
(a) 4.8 (b) 3.5
(c) 1.6 (d) 1.2 *(2003)*

40. The efficiency of Carnot engine is 50% and temperature of sink is 500 K. If temperature of source is kept constant and its efficiency raised to 60%, then the required temperature of sink will be
(a) 100 K (b) 600 K
(c) 400 K (d) 500 K. *(2002)*

41. A scientist says that the efficiency of his heat engine which work at source temperature 127°C and sink temperature 27°C is 26%, then
(a) it is impossible
(b) it is possible but less probable
(c) it is quite probable
(d) data are incomplete. *(2001)*

42. The (W/Q) of a Carnot engine is 1/6, now the temperature of sink is reduced by 62°C, then this ratio becomes twice, therefore the initial temperature of the sink and source are respectively
(a) 33°C, 67°C (b) 37°C, 99°C
(c) 67°C, 33°C (d) 97 K, 37 K. *(2000)*

43. To find out degree of freedom, the expression is
(a) $f = \frac{2}{\gamma - 1}$ (b) $f = \frac{\gamma + 1}{2}$
(c) $f = \frac{2}{\gamma + 1}$ (d) $f = \frac{1}{\gamma + 1}$. *(2000)*

44. An ideal gas at 27°C is compressed adiabatically to 8/27 of its original volume. The rise in temperature is (Take $\gamma = 5/3$)
(a) 275 K (b) 375 K
(c) 475 K (d) 175 K *(1999)*

45. If 1 g of steam is mixed with 1 g of ice, then resultant temperature of the mixture is
(a) 100°C (b) 230°C
(c) 270°C (d) 50°C *(1999)*

46. The coefficient of linear expansion of brass and steel are α_1 and α_2 respectively. When we take a brass rod of length l_1 and steel rod of length l_2 at 0°C, then difference in their lengths $(l_2 - l_1)$ will remain the same at some temperature, if
(a) $\alpha_1^2 l_2 = \alpha_2^2 l_2$ (b) $\alpha_1 l_2 = \alpha_2 l_1$
(c) $\alpha_1 l_1 = \alpha_2 l_2$ (d) $\alpha_1 l_2^2 = \alpha_2 l_1^2$ *(1999)*

47. The degrees of freedom of a triatomic gas is
(a) 6 (b) 4
(c) 2 (d) 8 *(1999)*

48. If the ratio of specific heat of a gas at constant pressure to that at constant volume is γ, the change in internal energy of a mass of gas, when the volume changes from V to $2V$ at constant pressure P, is
(a) $\frac{PV}{(\gamma - 1)}$ (b) PV
(c) $\frac{R}{(\gamma - 1)}$ (d) $\frac{\gamma PV}{(\gamma - 1)}$ *(1998)*

49. The radiant energy from the sun, incident normally at the surface of earth is 20 kcal/m^2 min. What would have been the radiant energy, incident normally on the earth, if the sun had a temperature, twice of the present one?
(a) 320 kcal/m^2 min (b) 40 kcal/m^2 min
(c) 160 kcal/m^2 min (d) 80 kcal/m^2 min
(1998)

50. We consider a thermodynamic system. If ΔU represents the increase in its internal energy and W the work done by the system, which of the following statements is true?
(a) $\Delta U = -W$ in an isothermal process
(b) $\Delta U = W$ in an isothermal process
(c) $\Delta U = -W$ in an adiabatic process
(d) $\Delta U = W$ in an adiabatic process *(1998)*

51. The efficiency of a Carnot engine operating with reservoir temperature of 100°C and – 23°C will be
(a) $\frac{373 + 250}{373}$ (b) $\frac{373 - 250}{373}$
(c) $\frac{100 + 23}{100}$ (d) $\frac{100 - 23}{100}$. *(1997)*

52. A sample of gas expands from volume V_1 to V_2. The amount of work done by the gas is greatest, when the expansion is
(a) adiabatic (b) equal in all cases
(c) isothermal (d) isobaric.
(1997)

53. The value of critical temperature in terms of van der Waals' constant a and b is given by
(a) $T_C = \frac{8a}{27Rb}$ (b) $T_C = \frac{27a}{8Rb}$
(c) $T_C = \frac{a}{2Rb}$ (d) $T_C = \frac{a}{27Rb}$. *(1996)*

54. An ideal gas, undergoing adiabatic change, has which of the following pressure temperature relationship?
(a) $P^{\gamma}T^{1-\gamma}$ = constant (b) $P^{1-\gamma}T^{\gamma}$ = constant
(c) $P^{\gamma-1}T^{\gamma}$ = constant (d) $P^{\gamma}T^{\gamma-1}$ = constant.
(1996)

55. A diatomic gas initially at 18°C is compressed adiabatically to one eighth of its original volume. The temperature after compression will be
(a) 395.4°C (b) 144°C
(c) 18°C (d) 887.4°C. *(1996)*

56. At 0 K which of the following properties of a gas will be zero?
(a) vibrational energy
(b) density
(c) kinetic energy
(d) potential energy. *(1996)*

57. An ideal Carnot engine, whose efficiency is 40%, receives heat at 500 K. If its efficiency is 50%, then the intake temperature for the same exhaust temperature is
(a) 800 K (b) 900 K
(c) 600 K (d) 700 K. *(1995)*

58. In an adiabatic change, the pressure and temperature of a monatomic gas are related as $P \propto T^C$, where C equals
(a) $\frac{3}{5}$ (b) $\frac{5}{3}$ (c) $\frac{2}{5}$ (d) $\frac{5}{2}$. *(1994)*

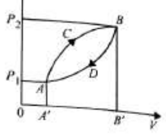
59. Which of the following is not thermodynamical function ?
(a) Enthalpy (b) Work done
(c) Gibb's energy (d) Internal energy *(1993)*

60. 110 joule of heat is added to a gaseous system whose internal energy is 40 J, then the amount of external work done is
(a) 150 J (b) 70 J
(c) 110 J (d) 40 J *(1993)*

61. An ideal gas A and a real gas B have their volumes increased from V to $2V$ under isothermal conditions. The increase in internal energy
(a) will be same in both A and B
(b) will be zero in both the gases
(c) of B will be more than that of A
(d) of A will be more than that of B *(1993)*

62. The number of transitional degrees of freedom for a diatomic gas is
(a) 2 (b) 3
(c) 5 (d) 6 *(1993)*

63. A thermodynamic system is taken from state A to B along ACB and is brought back to A along BDA as shown in the PV diagram. The net work done during the complete cycle is given by the area



(a) $P_1ACBP_2P_1$ (b) $ACBB'A'A$
(c) $ACBDA$ (d) $ADBB'A'A$ *(199[illegible])*

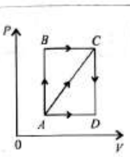
64. If for a gas, $\frac{R}{C_V} = 0.67$, this gas is made up of molecules which are
(a) diatomic
(b) mixture of diatomic and polyatomic molecules
(c) monoatomic
(d) polyatomic *(199[illegible])*

65. For hydrogen gas $C_P - C_V = a$ and for oxygen gas $C_P - C_V = b$, so the relation between a and b is given by
(a) $a = 16b$ (b) $16b = a$
(c) $a = 4b$ (d) $a = b$ *(199[illegible])*

66. Three containers of the same volume contain three different gases. The masses of the molecules are m_1, m_2 and m_3 and the number of molecules in their respective containers are N_1, N_2 and N_3. The gas pressure in the containers are P_1, P_2 and P_3 respectively. All the gases are now mixed and put in one these containers. The pressure P of the mixture will be
(a) $P < (P_1 + P_2 + P_3)$
(b) $P = \frac{P_1 + P_2 + P_3}{3}$
(c) $P = P_1 + P_2 + P_3$
(d) $P > (P_1 + P_2 + P_3)$ *(199[illegible])*

67. A thermodynamic process is shown in the figure. The pressure and volumes corresponding to some points in the figure are
$P_A = 3 \times 10^4$ Pa; $V_A = 2 \times 10^{-3}$ m³;
$P_B = 8 \times 10^4$ Pa; $V_D = 5 \times 10^{-3}$ m³.

In the process AB, 600 J of heat is added to the system and in process BC, 200 J of heat is added to the system. The change in internal energy of the system is process AC would be



(a) 560 J (b) 800 J
(c) 600 J (d) 640 J *(1991)*

68. Relation between pressure (P) and energy (E) of a gas is
(a) $P = \frac{2}{3}E$ (b) $P = \frac{1}{3}E$
(c) $P = E$ (d) $P = 3E$ *(1991)*

69. One mole of an ideal gas requires 207 J heat to rise the temperature by 10 K when heated at constant pressure. If the same gas is heated at constant volume to raise the temperature by the same 10 K, the heat required is
(Given the gas constant R = 8.3 J/mole K)
(a) 198.7 J (b) 29 J
(c) 215.3 J (d) 124 J *(1990)*

70. Thermal capacity of 40 g of aluminum (s = 0.2 cal/g K) is
(a) 168 J/K (b) 672 J/K
(c) 840 J/K (d) 33.6 J/K *(1990)*

71. According to kinetic theory of gases, at absolute zero of temperature
(a) water freezes
(b) liquid helium freezes
(c) molecular motion stops
(d) liquid hydrogen freezes *(1990)*

72. For a certain gas the ratio of specific heats is given to be $\gamma = 1.5$. For this gas
(a) $C_V = 3R/J$ (b) $C_P = 3R/J$
(c) $C_P = 5R/J$ (d) $C_V = 5R/J$ *(1990)*

73. A polyatomic gas with n degrees of freedom has a mean energy per molecule given by
(a) $\frac{nkT}{N}$ (b) $\frac{nkT}{2N}$
(c) $\frac{nkT}{2}$ (d) $\frac{3kT}{2}$ *(1989)*

74. At constant volume temperature is increased then
(a) collission on walls will be less
(b) number of collisions per unit time will increase
(c) collisions will be in straight lines
(d) collisions will not change *(1989)*

75. Two containers A and B are partly filled with water and closed. The volume of A is twice that of B and it contains half the amount of water in B. If both are at the same temperature, the water vapour in the containers will have pressure in the ratio of
(a) 1 : 2 (b) 1 : 1
(c) 2 : 1 (d) 4 : 1 *(1988)*

76. 10 gm of ice cubes at 0° C are released in a tumbler (water equivalent 55 g) at 40° C. Assuming that negligible heat is taken from the surroundings, the temperature of water in the tumbler becomes nearely (L = 80 cal/g)
(a) 31 °C (b) 22 °C
(c) 19 °C (d) 15 °C *(1988)*

77. First law of thermodynamics is consequence of conservation of
(a) work (b) energy
(c) heat (d) all of these *(1988)*

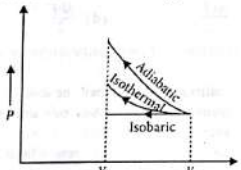
EXPLANATIONS

1. (c) : The P-V diagram of an ideal gas compressed from its initial volume V_0 to $\frac{V_0}{2}$ by several processes is shown in the figure.



Work done on the gas = Area under P–V curve
As area under the P–V curve is maximum for adiabatic process, so work done on the gas is maximum for adiabatic process.

2. (d) : According to an ideal gas equation, the molecular weight of an ideal gas is

$$M = \frac{\rho RT}{P} \qquad \left(\text{as } P = \frac{\rho RT}{M}\right)$$

where P, T and ρ are the pressure, temperature and density of the gas respectively and R is the universal gas constant.
$\therefore$ The molecular weight of A is

$$M_A = \frac{\rho_A RT_A}{P_A}$$

and that of B is $M_B = \frac{\rho_B RT_B}{P_B}$
Hence, their corresponding ratio is

$$\frac{M_A}{M_B} = \left(\frac{\rho_A}{\rho_B}\right)\left(\frac{T_A}{T_B}\right)\left(\frac{P_B}{P_A}\right)$$

Here, $\frac{\rho_A}{\rho_B} = 1.5 = \frac{3}{2}, \frac{T_A}{T_B} = 1$ and $\frac{P_A}{P_B} = 2$

$$\therefore \quad \frac{M_A}{M_B} = \left(\frac{3}{2}\right)(1)\left(\frac{1}{2}\right) = \frac{3}{4}$$

3. (c) : The coefficient of performance of a refrigerator is

$$\alpha = \frac{T_2}{T_1 - T_2}$$

where T_1 and T_2 are the temperatures of hot and cold reservoirs (in kelvin) respectively.

Here, $\alpha = 5$, $T_2 = -20°\text{C} = -20 + 273\text{ K} = 253\text{ K}$
$T_1 = ?$

$$\therefore \quad 5 = \frac{253\text{ K}}{T_1 - 253\text{ K}}$$

$$5T_1 - 5(253\text{ K}) = 253\text{ K}$$
$$5T_1 = 253\text{ K} + 5(253\text{ K}) = 6(253\text{ K})$$
$$T_1 = \frac{6}{5}(253\text{K}) = 303.6\text{ K} = 303.6 - 273$$
$$= 30.6°\text{C} \approx 31°\text{C}$$

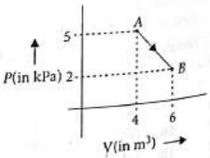
4. (a) For n degrees of freedom, $C_v = \frac{n}{2}R$
Also, $C_p - C_v = R$

$$C_p = C_v + R = \frac{n}{2}R + R$$
$$C_p = \left(\frac{n}{2} + 1\right)R$$
$$\gamma = \frac{C_p}{C_v} = \frac{\left(\frac{n}{2}+1\right)R}{(n/2)R} = \frac{n+2}{n} \quad \therefore \gamma = 1 + \frac{2}{n}$$

5. (a)

6. (d) : We know, $\Delta U = nC_v\Delta T$

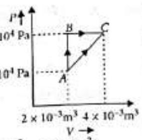
$$= n\left(\frac{5R}{2}\right)(T_B - T_A) \quad \left[\text{for diatomic gas}, C_v = \frac{5R}{2}\right]$$
$$= \frac{5nR}{2}\left(\frac{P_BV_B}{nR} - \frac{P_AV_A}{nR}\right) \quad [\because PV = nRT]$$



$$= \frac{5}{2}(P_BV_B - P_AV_A) = \frac{5}{2}(2\times10^3\times6 - 5\times10^3\times4)$$
$$= \frac{5}{2}(-8\times10^3) = -20\text{ kJ}$$

7. (a) : As initial and final points are same so

$\Delta U_{ABC} = \Delta U_{AC}$
AB is isochoric process.
$\Delta W_{AB} = 0$
$\Delta Q_{AB} = \Delta U_{AB} = 400$ J
BC is isobaric process.

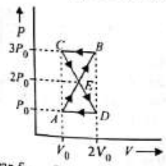


$\Delta Q_{BC} = \Delta U_{BC} + \Delta W_{BC}$
$100 = \Delta U_{BC} + 6\times10^4(4\times10^{-3} - 2\times10^{-3})$
$100 = \Delta U_{BC} + 12\times10$
$\Delta U_{BC} = 100 - 120 = -20$ J
As, $\Delta U_{ABC} = \Delta U_{AC}$
$\Delta U_{AB} + \Delta U_{BC} = \Delta Q_{AC} - \Delta W_{AC}$
$400 - 20 = \Delta Q_{AC} - (2\times10^4\times2\times10^{-3} + \frac{1}{2}\times2\times10^{-3}\times4\times10^4) = 460$ J

8. (c) : First, isothermal expansion
$PV = P'(2V)$
(For isothermal process, PV = constant)
$P' = \frac{P}{2}$
Then, adiabatic expansion
$P'(2V)^\gamma = P_f(16V)^\gamma$
(For adiabatic process, PV^γ = constant)

$$\frac{P}{2}(2V)^{5/3} = P_f(16V)^{5/3}$$
$$P_f = \frac{P}{2}\left(\frac{2V}{16V}\right)^{5/3} = \frac{P}{2}\left(\frac{1}{8}\right)^{5/3} = \frac{P}{2}\left(\frac{1}{2^3}\right)^{5/3}$$
$$= \frac{P}{2}\left(\frac{1}{2^5}\right) = \frac{P}{64}$$

9. (d) : In a cyclic process work done is equal to the area under the cycle and is positive if the cycle is clockwise and negative if anticlockwise.



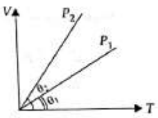
As is clear from figure,
W_{AEDA} = +area of $\Delta AED = +\frac{1}{2}P_0V_0$
W_{BCEB} = –Area of $\Delta BCE = -\frac{1}{2}P_0V_0$

The net work done by the system is
$W_{net} = W_{AEDA} + W_{BCEB}$
$= +\frac{1}{2}P_0V_0 - \frac{1}{2}P_0V_0 = \text{zero}$

10. (b) : Mean free path, $\lambda = \frac{1}{\sqrt{2}n\pi d^2}$
where n is the number density and d is the diameter of the molecule.
As $d = 2r$

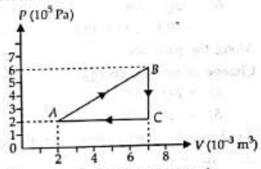
$$\therefore \quad \lambda = \frac{1}{4\sqrt{2}n\pi r^2} \quad \text{or} \quad \lambda \propto \frac{1}{r^2}$$

11. (a) : According to ideal gas equation
$PV = nRT$
or $V = \frac{nRT}{P}$
For an isobaric process, P = constant and $V \propto T$
Therefore, $V - T$ graph is a straight line passing through origin. Slope of this line is inversely proportional to P.



In the given figure,
$(\text{Slope})_2 > (\text{Slope})_1$
$\therefore \quad P_2 < P_1$

12. (d) : In a cyclic process, work done is equal to the area under the cycle and is positive if the cycle is clockwise and negative if the cycle is anticlockwise.



$\therefore$ The network done by the gas is
W = Area of the cycle $ABCA$

$$= \frac{1}{2}\times(7-2)\times10^{-3}\times(6-2)\times10^5$$
$$= \frac{1}{2}\times5\times10^{-3}\times4\times10^5$$
$$= 10\times10^2\text{ J} = 1000\text{ J}$$

13. (b) : $P \propto T^3$
PT^{-3} = constant ...(i)
For an adiabatic process,
$PT^{\gamma/1-\gamma}$ = constant ...(ii)

Comparing (i) and (ii), we get

$$\frac{\gamma}{1-\gamma} = -3$$
$$\gamma = -3 + 3\gamma$$
$$-2\gamma = -3 \text{ or } \gamma = \frac{3}{2}$$

As $\gamma = \frac{C_p}{C_v}$ $\therefore$ $\frac{C_p}{C_v} = \frac{3}{2}$

14. **(c) :** As here volume of the gas remains constant, therefore the amount of heat energy required to raise the temperature of the gas is

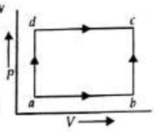
$$\Delta Q = nC_V \Delta T$$

Here,

Number of moles, $n = \frac{1}{4}$

$$C_V = \frac{3}{2}R \quad (\because \text{ He is a monatomic})$$
$$\Delta T = T_2 - T_1$$
$$\therefore \quad \Delta Q = \frac{1}{4}\frac{3}{2}R(T_2 - T_1)$$
$$= \frac{3}{8}N_a k_B (T_2 - T_1) \quad \left(\because k_B = \frac{R}{N_a}\right)$$

15. **(d) :** According to first law of thermodynamics,



$$\delta Q = \delta U + \delta W$$

Along the path *adc*

Change in internal energy,

$$\delta U_1 = \delta Q_1 - \delta W_1$$
$$= 50\text{ J} - 20\text{ J} = 30\text{ J}$$

Along the path *abc*

Change in internal energy,

$$\delta U_2 = \delta Q_2 - \delta W_2$$
$$\delta U_2 = 36\text{ J} - \delta W_2$$

As change in internal energy is path independent.

$$\therefore \quad \delta U_1 = \delta U_2$$
$$\therefore \quad 30\text{ J} = 36\text{ J} - \delta W_2$$
$$\delta W_2 = 36\text{ J} - 30\text{ J} = 6\text{ J}$$

16. **(d) :** For an adiabatic process,

$$PV^\gamma = \text{constant} \quad \text{...(i)}$$

According to ideal gas equation

$$PV = nRT \Rightarrow P = \frac{nRT}{V}$$

Putting (i), we get

$$\frac{nRT}{V}V^\gamma = \text{constant}$$

$$\therefore \quad TV^{\gamma-1} = \text{constant}$$

Again from the ideal gas equation

$$V = \frac{nRT}{P}$$

Putting in (i), we get

$$P\left(\frac{nRT}{P}\right)^\gamma = \text{constant}$$
$$P^{1-\gamma}T^\gamma = \text{constant}$$

17. **(c) :** Efficiency of a Carnot engine

$$\eta = 1 - \frac{T_2}{T_1}$$

where T_1 is the temperature of source and T_2 is the temperature of sink respectively.

For engine A, $\eta_A = 1 - \frac{T}{T_1}$

For engine B, $\eta_B = 1 - \frac{T_2}{T}$

As per question, $\eta_A = \eta_B$

$$\therefore \quad 1 - \frac{T}{T_1} = 1 - \frac{T_2}{T}$$
$$\Rightarrow \quad \frac{T}{T_1} = \frac{T_2}{T} \text{ or } T^2 = T_1T_2 \text{ or } T = \sqrt{T_1T_2}$$

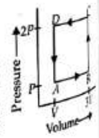
18. **(a) :** As $P = \frac{1}{3}\frac{mN}{V}v_{rms}^2$ ...(i)

where m is the mass of each molecule, N is the total number of molecules, V is the volume of the gas.

When mass of all the molecules is halved and their speed is doubled, then the pressure will be

$$P' = \frac{1}{3}\left(\frac{m}{2}\right) \times \frac{N}{V} \times (2v_{rms})^2$$
$$= \frac{2}{3}\frac{mN}{V}v_{rms}^2 = 2P \quad \text{(Using (i))}$$

19. **(a) :** In a cyclic process, $\Delta U = 0$.



In a cyclic process work done is equal to the area under the cycle and is positive if the cycle is clockwise and negative if anticlockwise.

$$\therefore \quad \Delta W = -\text{Area of rectangle } ABCD = -P(2V)$$
$$= -2PV$$

According to first law of thermodynamics

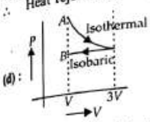
$$\Delta Q = \Delta U + \Delta W \text{ or } \Delta Q = \Delta W \quad (\text{As } \Delta U = 0)$$

i.e., heat supplied to the system is equal to the work done

So heat absorbed, $\Delta Q = \Delta W = -2PV$

$\therefore$ Heat rejected by the gas $= 2PV$

20. **(d) :**



21. **(a) :** Change in internal energy is path independent and depends only on the initial and final states.

As the initial and final states in the three processes are same. Therefore,

$$\Delta U_1 = \Delta U_2 = \Delta U_3$$

Workdone, W = Area under P-V graph

As area under curve 1 > area under curve 2 > area under curve 3

$$\therefore \quad W_1 > W_2 > W_3$$

According to first law of thermodynamics,

$$Q = W + \Delta U$$

As $W_1 > W_2 > W_3$ and $\Delta U_1 = \Delta U_2 = \Delta U_3$

$$\therefore \quad Q_1 > Q_2 > Q_3$$

22. **(d)**

23. **(d) :** Heat required to melt 1 kg ice at 0°C to water at 0°C is

$$Q = m_{ice}L_{ice} = (1\text{ kg})(80\text{ cal/g})$$
$$= (1000\text{ g})(80\text{ cal/g}) = 8 \times 10^4\text{ cal}$$

Change in entropy, $\Delta S = \frac{Q}{T} = \frac{8 \times 10^4\text{ cal}}{(273\text{ K})}$

$$= 293\text{ cal/K}$$

Note : In the question paper unit of latent heat of ice is given to be cal/°C. It is wrong. The unit of latent heat of ice is cal/g.

24. **(d) :** For an adiabatic process

$$\frac{T^\gamma}{P^{\gamma-1}} = \text{constant}$$
$$\therefore \quad \left(\frac{T_i}{T_f}\right)^\gamma = \left(\frac{P_i}{P_f}\right)^{\gamma-1}$$
$$P_f = P_i\left(\frac{T_f}{T_i}\right)^{\frac{\gamma}{\gamma-1}} \quad \text{...(i)}$$

Here, $T_i = 27°C = 300$ K

$T_f = 927°C = 1200$ K

$P_i = 2$ atm

$\gamma = 1.4$

Substituting these values in eqn (i), we get

$$P_f = (2)\left(\frac{1200}{300}\right)^{\frac{1.4}{1.4-1}}$$
$$= (2)(4)^{1.4/0.4} = 2(2^2)^{7/2} = (2)(2)^7 = 2^8 = 256\text{ atm}$$

25. **(a) :** According to first law of thermodynamics

$$\Delta Q = \Delta U + \Delta W \quad \text{...(i)}$$

where,

ΔQ = Heat supplied to the system

ΔU = Increase in internal energy of the system

ΔW = Work done by the system

For an adiabatic process

$$\Delta Q = 0$$

From equation (i), we get

$$\Delta U = -\Delta W$$

For an isothermal process

$$\Delta U = 0$$

From equation (i), we get

$$\Delta Q = \Delta W$$

Hence, option (a) is true.

26. **(c) :** Let C_V and C_P be molar specific heats of the ideal gas at constant volume and constant pressure, respectively, then

$$C_P = Mc_p \text{ and } C_V = Mc_v$$
$$C_P - C_V = R \quad \therefore \quad Mc_p - Mc_v = R$$
$$\Rightarrow \quad c_p - c_v = R/M$$

27. **(d) :** Ideal gas equation, for an adiabatic process is

$$PV^\gamma = \text{constant or } P_1V_1^\gamma = P_2V_2^\gamma$$

For monoatomic gas $\gamma = \frac{5}{3}$

$$\therefore \quad P_1V_1^{5/3} = P_2\left(\frac{V_1}{8}\right)^{5/3}$$
$$\Rightarrow \quad P_2 = P_1 \times (2)^5 = 32\,P_1.$$

28. **(c) :** Heat energy given $dQ = dU + dW$ where dU is the change in internal energy and dW is the work done.

Given $dQ = 2$ kcal $= 2000 \times 4.2$ J and $dW = 500$ J

$$\therefore \quad dQ = 2000 \times 4.2 = dU + 500 \Rightarrow dU = 7900\text{ J}.$$

29. **(a) :** In isochoric process, it is volume that is kept constant. If pressure is kept constant, it is an isobaric process.

30. **(b) :** Mass of the gas $= m$.

At a fixed temperature and pressure, volume is fixed.

Density of the gas $\rho = \frac{m}{V} \Rightarrow \frac{m}{V.P} = \frac{m}{nRT} = x$

$\therefore \quad xT = \text{constant}$.
At 10°C *i.e.*, 283 K, $xT = x\,283$ K
At 110°C, $xT = x'\,383$ K

$\Rightarrow \quad x' = \dfrac{283}{383}x$

31. **(a)** : Internal energy depends only on the initial and final states of temperature and not on the path. In a cyclic process, as initial and final states are the same, the internal energy change is zero. Hence E is ΔU, the internal energy change

32. **(c)** : Efficiency of an engine, $\eta = 1 - \dfrac{T_2}{T_1}$

where T_1 is the temperature of the source and T_2 is the temperature of the sink.

$\therefore \quad \dfrac{1}{6} = 1 - \dfrac{T_2}{T_1} \quad \text{or,} \quad \dfrac{T_2}{T_1} = \dfrac{5}{6} \qquad \ldots(i)$

When the temperature of the sink is decreased by 62°C (or 62 K), efficiency becomes double.
Since, the temperature of the source remain unchanged

$\therefore \quad 2 \times \dfrac{1}{6} = 1 - \dfrac{(T_2 - 62)}{T_1} \quad \text{or,} \quad \dfrac{1}{3} = 1 - \dfrac{(T_2 - 62)}{T_1}$

or, $\quad \dfrac{2}{3} = \dfrac{T_2 - 62}{T_1} \quad \text{or,} \ 2T_1 = 3T_2 - 186$

or, $\quad 2T_1 = 3\left[\dfrac{5}{6}\right]T_1 - 186 \qquad$ [using (i)]

$\therefore \quad \left[\dfrac{5}{2} - 2\right]T_1 = 186 \quad \text{or,} \quad \dfrac{T_1}{2} = 186$

or, $\quad T_1 = 372 \text{ K} = 99°\text{C}$.

33. **(d)** : Efficiency of a Carnot engine, $\eta = 1 - \dfrac{T_2}{T_1}$

or, $\quad \dfrac{T_2}{T_1} = 1 - \eta = 1 - \dfrac{40}{100} = \dfrac{3}{5}$

$\therefore \quad T_1 = \dfrac{5}{3} \times T_2 = \dfrac{5}{3} \times 300 = 500 \text{ K}$.

Increase in efficiency = 50% of 40% = 20%
New efficiency, $\eta' = 40\% + 20\% = 60\%$

$\therefore \quad \dfrac{T_2}{T_1'} = 1 - \dfrac{60}{100} = \dfrac{2}{5}$

$\quad T_1' = \dfrac{5}{2} \times T_2 = \dfrac{5}{2} \times 300 = 750 \text{ K}$.

Increase in temperature of source = $T_1' - T_1$
$= 750 - 500 = 250$ **K**.

34. **(b)** : Molar specific heat at constant pressure

$C_P = \dfrac{7}{2}R$

Since, $C_P - C_V = R$

or, $\quad C_V = C_P - R = \dfrac{7}{2}R - R = \dfrac{5}{2}R$

$\therefore \quad \dfrac{C_P}{C_V} = \dfrac{(7/2)R}{(5/2)R} = \dfrac{7}{5}$

35. **(d)** : $1 - \dfrac{T_2}{T_1} = 1 - \dfrac{Q_2}{Q_1} \Rightarrow 1 - \dfrac{400}{500} = 1 - \dfrac{Q_2}{6 \times 10^4}$

$\Rightarrow \quad \dfrac{4}{5} = \dfrac{Q_2}{6 \times 10^4}$

$\Rightarrow \quad Q_2 = 4.8 \times 10^4$ cal.

Net heat converted into work
$= 6.0 \times 10^4 - 4.8 \times 10^4 = 1.2 \times 10^4$ cal

36. **(c)** : Isothermal compression is reversible, for example, Carnot cycle, heat engine.

37. **(a)** : As $PV = nRT$

$n = \dfrac{m}{\text{molecular mass}} = \dfrac{5}{32} \Rightarrow PV = \left(\dfrac{5}{32}\right)RT$

38. **(d)** : Work done in adiabatic process is given as

$W = \dfrac{-1}{\gamma - 1}(P_fV_f - P_iV_i)$

$6R = \dfrac{-1}{5/3 - 1}R(T_f - T_i) \quad$ [using $PV = RT$]

$\Rightarrow \quad T_f - T_i = -4$
$\Rightarrow \quad T_f = (T - 4)$ K.

39. **(d)** : Efficiency of Carnot engine

$= \dfrac{W}{Q_1} = 1 - \dfrac{T_2}{T_1}$

$\dfrac{W}{6} = 1 - \dfrac{400}{500} = \dfrac{1}{5} \Rightarrow W = \dfrac{6}{5} = 1.2$ kcal

40. **(c)** : Efficiency (η) of a carnot engine is given by
$\eta = 1 - \dfrac{T_2}{T_1}$, where T_1 is the temperature of the source and T_2 is the temperature of the sink.
Here, $T_2 = 500$ K.

$\therefore \quad 0.5 = 1 - \dfrac{500}{T_1} \Rightarrow T_1 = 1000 \text{ K}$.

Now, $\eta = 0.6 = 1 - \dfrac{T_2'}{1000}$ (T_2' is the new sink temperature)

$\Rightarrow \quad T_2' = 400$ K.

41. **(a)** : Efficiency is maximum in Carnot engine which is an ideal engine.

$\eta = \dfrac{400 - 300}{400} \times 100\% = 25\%$

$\therefore$ efficiency 26% is impossible for his heat engine.

42. **(b)** : $\dfrac{1}{6} = 1 - \dfrac{T_2}{T_1}$ or $\dfrac{5}{6} = \dfrac{T_2}{T_1}$

and $\dfrac{1}{3} = 1 - \dfrac{T_2 - 62}{T_1} = 1 - \dfrac{5}{6} + \dfrac{62}{T_1}$

$T_1 = 62 \times 6 = 99°\text{C}$ and $T_2 = 37°\text{C}$

43. **(a)** : $\gamma = 1 + \dfrac{2}{f}$

where f is the degree of freedom

$\therefore \quad \dfrac{2}{f} = \gamma - 1$ or $f = \dfrac{2}{\gamma - 1}$

44. **(b)** : $TV^{\gamma-1}$ = constant (adiabatic)
$= (300)(V_0)^{2/3} = (V_f)^{2/3}\,T$

$T = 300\left(\dfrac{27}{8}\right)^{2/3} = 300 \times \left(\dfrac{3}{2}\right)^{2} = \dfrac{300 \times 9}{4} = 675$ K

Temperature rise = $675 - 300 = 375$ K

45. **(a)**

46. **(c)** : $L_1 = l_1(1 + \alpha_1 t)$ L_1, L_2 = Final lengths
$L_2 = l_2(1 + \alpha_2 t)$
$L_1 - L_2 = l_1 - l_2 + t(l_1\alpha_1 - l_2\alpha_2)$
For difference to remain same
$\alpha_1 l_1 - \alpha_2 l_2 = 0 \Rightarrow \alpha_1 l_1 = \alpha_2 l_2$

47. **(a)** : 3 translational, 3 rotational

48. **(a)** : As $C_p/C_v = \gamma$, $\therefore \dfrac{C_p - C_v}{C_v} = \gamma - 1$

or, $\quad \dfrac{C_p - C_v}{\gamma - 1} = \dfrac{R}{\gamma - 1}$

Change in internal energy, $\Delta U = nC_V\Delta T$

$= \dfrac{nRdT}{(\gamma - 1)} = \dfrac{nPdV}{(\gamma - 1)} = \dfrac{nP(2V - V)}{\gamma - 1}$

For one mole, $n = 1$. $\therefore \Delta U = PV/(\gamma - 1)$.

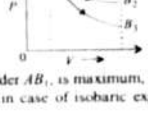
49. **(a)** : $E = \sigma T^4 = 20$. $T' = 2T$
$E' = \sigma(2T)^4 = 16\,\sigma T^4$
$= 16 \times 20 = 320$ kcal/m² min

50. **(c)** : According to first law of thermodynamics
$\Delta Q = \Delta U + W$
For an adiabatic process, $\Delta Q = 0$.
$\Delta U = -W$.

51. **(b)** : Reservoir temperature (T_1) = 100°C = 373 K
and $T_2 = -23°\text{C} = 250$ K
The efficiency of a Carnot engine

$\eta = \dfrac{T_1 - T_2}{T_1} = \dfrac{373 - 250}{373}$

52. **(d)** : During expansion, work is performed by the gas. The isobaric expansion is represented by the horizontal straight line AB_1, since the adiabatic curve is steeper than the isothermal curve, the adiabatic expansion curve (AB_3) must lie below the isothermal curve (AB_2) as shown in the figure below



Since area under AB_1, is maximum, the work done is maximum in case of isobaric expansion.

53. **(a)**

54. **(b)** : For the adiabatic change, PV^{γ} = constant.

And for ideal gas, $V = \dfrac{RT}{P} \propto \dfrac{T}{P}$

Therefore $P^{1-\gamma}T^{\gamma}$ = Constant

55. **(a)** : Initial temperature (T_1) = 18°C
$= (273 + 18) = 291$ K and $V_2 = (1/8)\,V_1$

For adiabatic compression, $TV^{\gamma-1}$ = constant

or $\quad T_1V_1^{\gamma-1} = T_2V_2^{\gamma-1}$

Therefore $T_2 = T_1\left(\dfrac{V_1}{V_2}\right)^{\gamma-1}$

$= 291 \times (8)^{1.4-1} = 291 \times (8)^{0.4}$
$= 291 \times 2.297 = 668.4 \text{ K} = 395.4°\text{C}$

56. **(c)**

57. **(c)** : Efficiency of Carnot engine (η_1) = 40% = 0.4;
Heat intake = 500 K and
New efficiency (η_2) = 50 % = 0.5.

The efficiency (η) = $1 - \dfrac{T_2}{T_1}$ or $\dfrac{T_2}{T_1} = 1 - \eta$

For first case, $\dfrac{T_2}{500} = 1 - 0.4$ or $T_2 = 300$ K

For second case, $\dfrac{300}{T_1} = 1 - 0.5$ or $T_1 = 600$ K

58. **(d) :** For adiabatic change, PV^{γ} = constant

$\Rightarrow \quad P\left(\frac{RT}{\rho}\right)^{\gamma}$ = constant $\Rightarrow P^{1-\gamma}T^{\gamma}$ = constant

$\Rightarrow \quad P \propto T^{\frac{-\gamma}{1-\gamma}}$.

Therefore, the value of constant $C = \frac{\gamma}{(\gamma-1)}$. For monoatomic gas, $\gamma = \frac{5}{3}$.

Therefore $C = \frac{5/3}{(5/3)-1} = \frac{5/3}{2/3} = \frac{5}{2}$.

59. **(b) :** Work done is not a thermodynamical function.

60. **(b) :** $\Delta Q = \Delta U + \Delta W$

$\Rightarrow \quad \Delta W = \Delta Q - \Delta U = 110 - 40 = 70$ J.

61. **(b) :** Under isothermal conditions, there is no change in internal energy.

62. **(b) :** Number of translational degrees of freedom are same for all types of gases.

63. **(c) :** Work done = Area under curve $ACBDA$

64. **(c) :** Since $\frac{R}{C_V} = 0.67 \Rightarrow \frac{C_P - C_V}{C_V} = 0.67$

$\Rightarrow \quad \gamma = 1.67 = \frac{5}{3}$

Hence gas is monoatomic.

65. **(d) :** $C_P - C_V = R$ for all gases.

66. **(c) :** According to Dalton's law of partial pressure, we have $P = P_1 + P_2 + P_3$

67. **(a) :** Since AB is a isochoric process. So no work is done. BC is isobaric process

$W = P_B \times (V_D - V_A) = 240$ J

Therefore $\Delta Q = 600 + 200 = 800$ J

Using $\Delta Q = \Delta U + \Delta W$

$\Rightarrow \quad \Delta U = \Delta Q - \Delta W = 800 - 240 = 560$ J

68. **(a) :** $\frac{1}{3}Nmc^2 = \frac{2}{3}\left(\frac{1}{2}Nm\right)c^2 = \frac{2}{3}E$

69. **(d) :** Using $C_P - C_V = R$,

C_P is heat needed for raising by 10 K.

$\therefore \quad C_P = 20.7$ J/mole K

Given $R = 8.3$ J/mole K

$\therefore \quad C_V = 20.7 - 8.3 = 12.4$ J/mole K

$\therefore \quad$ For raising by 10 K = 124 J.

70. **(d) :** Thermal capacity = $ms = 40 \times 0.2 = 8$ cal/°K

8 cal = 4.2 × 8 J = 33.6 joule/°K.

71. **(c) :** According to classical theory all motion of molecules stop at 0 K.

72. **(b) :** $\gamma = \frac{C_P}{C_V} = \frac{15}{10} = \frac{3}{2} \Rightarrow C_V = \frac{2}{3}C_P$

$C_P - C_V = \frac{R}{J}$ or $C_P - \frac{2}{3}C_P = \frac{R}{J}$

or $\quad \frac{C_P}{3} = \frac{R}{J}$ or $C_P = \frac{3R}{J}$

73. **(c) :** According to law of equipartition of energy, the energy per degree of freedom is $\frac{1}{2}kT$. For a polyatomic gas with n degrees of freedom, the mean energy per molcule = $\frac{1}{2}nkT$

74. **(b) :** As the temperature increases, the average velocity increases. So, the collisions are faster.

75. **(b) :** Vapour pressure does not depend on the amount of substance. It depends on the temperature alone.

76. **(b) :** Let the final temperature be T

Heat required by ice $= mL + m \times s \times (T-0)$
$= 10 \times 80 + 10 \times 1 \times T$

Heat lost by water = $55 \times (40 - T)$

By using law of calorimetry,

heat gained = heat lost

$800 + 10T = 55 \times (40 - T)$

$\Rightarrow \quad T = 21.54°C = 22°C$

77. **(b) :** Conservation of energy.

CHAPTER

10 Oscillations

1. A string is stretched between fixed points separated by 75.0 cm. It is observed to have resonant frequencies of 420 Hz and 315 Hz. There are no other resonant frequencies between these two. The lowest resonant frequency for this string is

(a) 10.5 Hz
(b) 105 Hz
(c) 155 Hz
(d) 205 Hz

(AIPMT 2015)

2. A particle is executing a simple harmonic motion. Its maximum acceleration is α and maximum velocity is β. Then, its time period of vibration will be

(a) $\frac{\beta^2}{\alpha}$
(b) $\frac{2\pi\beta}{\alpha}$
(c) $\frac{\beta^2}{\alpha^2}$
(d) $\frac{\alpha}{\beta}$

(AIPMT 2015)

3. A particle is executing SHM along a straight line. Its velocities at distances x_1 and x_2 from the mean position are V_1 and V_2, respectively. Its time period is

(a) $2\pi\sqrt{\frac{V_1^2 + V_2^2}{x_1^2 + x_2^2}}$
(b) $2\pi\sqrt{\frac{V_1^2 - V_2^2}{x_1^2 - x_2^2}}$
(c) $2\pi\sqrt{\frac{x_1^2 + x_2^2}{V_1^2 + V_2^2}}$
(d) $2\pi\sqrt{\frac{x_2^2 - x_1^2}{V_1^2 - V_2^2}}$

(AIPMT 2015, Cancelled)

4. When two displacements represented by $y_1 = a\sin(\omega t)$ and $y_2 = b\cos(\omega t)$ are superimposed the motion is

(a) simple harmonic with amplitude $\sqrt{a^2 + b^2}$
(b) simple harmonic with amplitude $\frac{(a+b)}{2}$
(c) not a simple harmonic
(d) simple harmonic with amplitude $\frac{a}{b}$

(AIPMT 2015, Cancelled)

5. The oscillation of a body on a smooth horizontal surface is represented by the equation,

$X = A\cos(\omega t)$

where X = displacement at time t

ω = frequency of oscillation

Which one of the following graphs shows correctly the variation a with t?

(a) 
(b) 
(c) 
(d) 
Here a = acceleration at time t

T = time period

(AIPMT 2014)

6. A particle of mass m oscillates along x-axis according to equation $x = a\sin\omega t$. The nature of the graph between momentum and displacement of the particle is

(a) Circle
(b) Hyperbola

(c) Ellipse
(d) Straight line passing through origin
(Karnataka NEET 2013)

7. Out of the following functions representing motion of a particle which represents SHM
(1) $y = \sin\omega t - \cos\omega t$
(2) $y = \sin^3\omega t$
(3) $y = 5\cos\left(\frac{3\pi}{4} - 3\omega t\right)$
(4) $y = 1 + \omega t + \omega^2 t^2$
(a) Only (1)
(b) Only (4) does not represent SHM
(c) Only (1) and (3)
(d) Only (1) and (2) *(Prelims 2011)*

8. Two particles are oscillating along two close parallel straight lines side by side, with the same frequency and amplitudes. They pass each other, moving in opposite directions when their displacement is half of the amplitude. The mean positions of the two particles lie on a straight line perpendicular to the paths of the two particles. The phase difference is
(a) $\frac{\pi}{6}$ (b) 0
(c) $\frac{2\pi}{3}$ (d) π *(Mains 2011)*

9. The displacement of a particle along the x axis is given by $x = a\sin^2\omega t$. The motion of the particle corresponds to
(a) simple harmonic motion of frequency ω/π
(b) simple harmonic motion of frequency $3\omega/2\pi$
(c) non simple harmonic motion
(d) simple harmonic motion of frequency $\omega/2\pi$
(Prelims 2010)

10. The period of oscillation of a mass M suspended from a spring of negligible mass is T. If along with it another mass M is also suspended, the period of oscillation will now be
(a) T (b) $\frac{T}{\sqrt{2}}$
(c) $2T$ (d) $\sqrt{2}T$ *(Prelims 2010)*

11. A simple pendulum performs simple harmonic motion about $x = 0$ with an amplitude a and time period T. The speed of the pendulum at $x = a/2$ will be
(a) $\frac{\pi a}{T}$ (b) $\frac{3\pi^2 a}{T}$
(c) $\frac{\pi a\sqrt{3}}{T}$ (d) $\frac{\pi a\sqrt{3}}{2T}$
(Prelims 2009)

12. Which one of the following equations of motion represents simple harmonic motion?
(a) Acceleration = $-k(x + a)$
(b) Acceleration = $k(x + a)$
(c) Acceleration = kx
(d) Acceleration = $-k_0x + k_1x^2$
where k, k_0, k_1 and a are all positive.
(Prelims 2009)

13. Two simple harmonic motions of angular frequency 100 and 1000 rad s^{-1} have the same displacement amplitude. The ratio of their maximum acceleration is
(a) $1 : 10^3$ (b) $1 : 10^4$
(c) $1 : 10$ (d) $1 : 10^2$
(Prelims 2008)

14. A particle executes simple harmonic oscillation with an amplitude a. The period of oscillation is T. The minimum time taken by the particle to travel half of the amplitude from the equilibrium position is
(a) $T/8$ (b) $T/12$
(c) $T/2$ (d) $T/4$. *(2007)*

15. A mass of 2.0 kg is put on a flat pan attached to a vertical spring fixed on the ground as shown in the figure. The mass of the spring and the pan is negligible.

When pressed slightly and released the mass executes a simple harmonic motion. The spring constant is 200 N/m. What should be the minimum amplitude of the motion so that the mass gets detached from the pan (take g = 10 m/s^2).
(a) 10.0 cm
(b) any value less than 12.0 cm
(c) 4.0 cm
(d) 8.0 cm. *(2007)*

16. The particle executing simple harmonic motion has a kinetic energy $K_0\cos^2\omega t$. The maximum values of the potential energy and the total energy are respectively
(a) $K_0/2$ and K_0 (b) K_0 and $2K_0$
(c) K_0 and K_0 (d) 0 and $2K_0$. *(2007)*

17. The phase difference between the instantaneous velocity and acceleration of a particle executing simple harmonic motion is
(a) π (b) 0.707π
(c) zero (d) 0.5π. *(2007)*

18. A rectangular block of mass m and area of cross-section A floats in a liquid of density ρ. If it is given a small vertical displacement from equilibrium it undergoes with a time period T, then
(a) $T \propto \frac{1}{\sqrt{m}}$ (b) $T \propto \sqrt{\rho}$
(c) $T \propto \frac{1}{\sqrt{A}}$ (d) $T \propto \frac{1}{\rho}$ *(2006)*

19. The circular motion of a particle with constant speed is
(a) periodic but not simple harmonic
(b) simple harmonic but not periodic
(c) period and simple harmonic
(d) neither periodic not simple harmonic.
(2005)

20. A particle executing simple harmonic motion of amplitude 5 cm has maximum speed of 31.4 cm/s. The frequency of its oscillation is
(a) 4 Hz (b) 3 Hz
(c) 2 Hz (d) 1 Hz. *(2004)*

21. Two springs of spring constants k_1 and k_2 are joined in series. The effective spring constant of the combination is given by
(a) $\sqrt{k_1k_2}$ (b) $(k_1 + k_2)/2$
(c) $k_1 + k_2$ (d) $k_1k_2/(k_1 + k_2)$
(2004)

22. Which one of the following statements is true for the speed v and the acceleration a of a particle executing simple harmonic motion ?
(a) When v is maximum, a is maximum.
(b) Value of a is zero, whatever may be the value of v.
(c) When v is zero, a is zero.
(d) When v is maximum, a is zero. *(2003)*

23. The potential energy of a simple harmonic oscillator when the particle is half way to its end point is
(a) $\frac{2}{3}E$ (b) $\frac{1}{8}E$
(c) $\frac{1}{4}E$ (d) $\frac{1}{2}E$ *(2003)*
where E is the total energy.

24. A particle of mass m oscillates with simple harmonic motion between points x_1 and x_2, the equilibrium position being O. Its potential energy is plotted. It will be as given below in the graph

(a) (b) (c) (d) 
(2003)

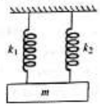
25. The time period of mass suspended from a spring is T. If the spring is cut into four equal parts and the same mass is suspended from one of the parts, then the new time period will be
(a) $T/4$ (b) T
(c) $T/2$ (d) $2T$ *(2003)*

26. In case of a forced vibration, the resonance peak becomes very sharp when the
(a) damping force is small
(b) restoring force is small
(c) applied periodic force is small
(d) quality factor is small *(2003)*

27. Displacement between maximum potential energy position and maximum kinetic energy postion for a particle executing simple harmonic motion is
(a) $\pm a/2$ (b) $+a$
(c) $\pm a$ (d) -1. *(2002)*

28. When an oscillator completes 100 oscillations its amplitude reduced to $\frac{1}{3}$ of initial value. What will be its amplitude, when it . ~~~~pletes 200 oscillations?
(a) $\frac{1}{8}$ (b) $\frac{2}{3}$
(c) $\frac{1}{6}$ (d) $\frac{1}{9}$. *(2002)*

29. A mass is suspended separately by two different springs in successive order then time periods is t_1 and t_2 respectively. If it is connected by both spring as shown in figure then time period is t_0, the correct relation is



(a) $t_0^2 = t_1^2 + t_2^2$ (b) $t_0^{-2} = t_1^{-2} + t_2^{-2}$
(c) $t_0^{-1} = t_1^{-1} + t_2^{-1}$ (d) $t_0 = t_1 + t_2$. *(2002)*

30. The total energy of particle performing SHM depend on
(a) k, a, m (b) k, a
(c) k, a, x (d) k, x. *(2001)*

31. Two masses M_A and M_B are hung from two strings of length l_A and l_B respectively. They are executing SHM with frequency relation $f_A = 2f_B$, then relation
(a) $l_A = \frac{l_B}{4}$, does not depend on mass
(b) $l_A = 4l_B$, does not depend on mass
(c) $l_A = 2l_B$ and $M_A = 2M_B$
(d) $l_A = \frac{l_B}{2}$ and $M_A = \frac{M_B}{2}$. *(2000)*

32. The bob of simple pendulum having length l, is displaced from mean position to an angular position q with respect to vertical. If it is released, then velocity of bob at equilibrium position
(a) $\sqrt{2gl(1-\cos\theta)}$ (b) $\sqrt{2gl(1+\cos\theta)}$
(c) $\sqrt{2gl\cos\theta}$ (d) $\sqrt{2gl}$. *(2000)*

33. Time period of a simple pendulum is 2 sec. If its length is increased by 4 times, then its period becomes
(a) 8 sec (b) 12 sec
(c) 16 sec (d) 4 sec *(1999)*

34. A particle, with restoring force proportional to displacement and resisting force proportional to velocity is subjected to a force $F \sin \omega t$. If the amplitude of the particle is maximum for $\omega = \omega_1$ and the energy of the particle maximum for $\omega = \omega_2$, then
(a) $\omega_1 \neq \omega_0$ and $\omega_2 = \omega_0$
(b) $\omega_1 = \omega_0$ and $\omega_2 = \omega_0$
(c) $\omega_1 = \omega_0$ and $\omega_2 \neq \omega_0$
(d) $\omega_1 \neq \omega_0$ and $\omega_2 \neq \omega_0$ *(1989, 199[illegible])*

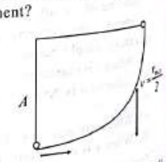
35. Two simple pendulums of length 5 m and 20 m respectively are given small linear displacement in one direction at the same time. They will again be in the phase when the pendulum of shorter length has completed—oscillations.
(a) 2 (b) 1
(c) 5 (d) 3 *(199[illegible])*

36. A mass m is vertically suspended from a spring of negligible mass; the system oscillates with a frequency n. What will be the frequency of the system, if a mass 4 m is suspended from the same spring?
(a) $\frac{n}{2}$ (b) $4n$
(c) $\frac{n}{4}$ (d) $2n$ *(199[illegible])*

37. If the length of a simple pendulum is increased by 2%, then the time period
(a) increases by 1% (b) decreases by 1%
(c) increases by 2% (d) decreases by 2% *(1997)*

38. Two SHM's with same amplitude and time period when acting together in perpendicular directions with a phase difference of $\pi/2$, give rise to
(a) straight motion (b) elliptical motion
(c) circular motion (d) none of these. *(1997)*

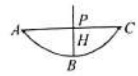
39. A particle starts with S.H.M. from the mean position as shown in the figure. Its amplitude is A and its time period is T. At one time, its speed is half that of the maximum speed. What is this displacement?
(a) $\frac{2A}{\sqrt{3}}$
(b) $\frac{3A}{\sqrt{2}}$
(c) $\frac{\sqrt{2}A}{3}$
(d) $\frac{\sqrt{3}A}{2}$. *(1996)*



40. A linear harmonic oscillator of force constant 2×10^6 N/m and amplitude 0.01 m has a total mechanical energy of 160 J. Its

(a) P.E. is 160 J (b) P.E. is zero
(c) P.E. is 100 J (d) P.E. is 120 J. *(1996)*

41. A simple pendulum with a bob of mass m oscillates from A to C and back to A such that PB is H. If the acceleration due to gravity is g, then the velocity of the bob as it passes through B is
(a) mgH
(b) $\sqrt{2gH}$
(c) zero
(d) $2gH$. *(1995)*



42. In a simple harmonic motion, when the displacement is one-half the amplitude, what fraction of the total energy is kinetic?
(a) 1/2 (b) 3/4
(c) zero (d) 1/4. *(1995)*

43. A body of mass 5 kg hangs from a spring and oscillates with a time period of 2π seconds. If the ball is removed, the length of the spring will decrease by
(a) g/k metres (b) k/g metres
(c) 2π metres (d) g metres. *(1994)*

44. A particle executes S.H.M. along x-axis. The force acting on it is given by
(a) $A \cos (kx)$ (b) Ae^{-kx}
(c) Akx (d) $-Akx$. *(1994, 88)*

45. A seconds pendulum is mounted in a rocket. Its period of oscillation will decrease when rocket is
(a) moving down with uniform acceleration
(b) moving around the earth in geostationary orbit
(c) moving up with uniform velocity
(d) moving up with uniform acceleration. *(1994)*

46. A loaded vertical spring executes S.H.M. with a time period of 4 sec. The difference between the kinetic energy and potential energy of this system varies with a period of
(a) 2 sec (b) 1 sec
(c) 8 sec (d) 4 sec. *(1994)*

47. A body executes simple harmonic motion with an amplitude A. At what displacement from the mean position is the potential energy of the body is one fourth of its total energy?
(a) $A/4$
(b) $A/2$
(c) $3A/4$
(d) Some other fraction of A *(1993)*

48. A simple harmonic oscillator has an amplitude A and time period T. The time required by it to travel from $X = A$ to $A = A/2$ is
(a) $T/6$ (b) $T/4$
(c) $T/3$ (d) $T/2$ *(1992)*

49. If a simple harmonic oscillator has got a displacement of 0.02 m and acceleration equal to 0.02 m/s² at any time, the angular frequency of the oscillator is equal to
(a) 10 rad/s (b) 0.1 rad/s
(c) 100 rad/s (d) 1 rad/s *(1992)*

50. A simple pendulum is suspended from the roof of a trolley which moves in a horizontal direction with an acceleration a, then the time period is given by $T = 2\pi\sqrt{(l/g)}$, where g is equal to
(a) g (b) $g - a$
(c) $g + a$ (d) $\sqrt{(g^2 + a^2)}$ *(1991)*

51. A body is executing simple harmonic motion. When the displacements from the mean position is 4 cm and 5 cm, the corresponding velocities of the body is 10 cm/sec and 8 cm/sec. Then the time period of the body is
(a) 2π sec (b) $\pi/2$ sec
(c) π sec (d) $(3\pi/2)$ sec *(1991)*

52. The angular velocity and the amplitude of a simple pendulum is ω and a respectively. At a displacement x from the mean position if its kinetic energy is T and potential energy is V, then the ratio of T to V is
(a) $\frac{(a^2 - x^2\omega^2)}{x^2\omega^2}$ (b) $\frac{x^2\omega^2}{(a^2 - x^2\omega^2)}$
(c) $\frac{(a^2 - x^2)}{x^2}$ (d) $\frac{x^2}{(a^2 - x^2)}$ *(1991)*

53. The composition of two simple harmonic motions of equal periods at right angle to each other

and with a phase difference of π results in the displacment of the particle along
(a) circle (b) figure of eight
(c) straight line (d) ellipse *(1990)*

54. A mass m is suspended from the two coupled springs connected in series. The force constant for springs are k_1 and k_2. The time period of the suspended mass will be

(a) $T = 2\pi\sqrt{\dfrac{m}{k_1 - k_2}}$ (b) $T = 2\pi\sqrt{\dfrac{mk_1k_2}{k_1 + k_2}}$

(c) $T = 2\pi\sqrt{\dfrac{m}{k_1 + k_2}}$ (d) $T = 2\pi\sqrt{\dfrac{m(k_1 + k_2)}{k_1k_2}}$

(199…)

EXPLANATIONS

1. **(b)** : For a string fixed at both ends, the resonant frequencies are

$\upsilon_n = \dfrac{nv}{2L}$ where $n = 1, 2, 3, \ldots$

The difference between two consecutive resonant frequencies is

$$\Delta\upsilon_n = \upsilon_{n+1} - \upsilon_n = \frac{(n+1)v}{2L} - \frac{nv}{2L} = \frac{v}{2L}$$

which is also the lowest resonant frequency ($n = 1$).

Thus the lowest resonant frequency for the given string
$= 420\text{ Hz} - 315\text{ Hz} = 105\text{ Hz}$

2. **(b)** : If A and ω be amplitude and angular frequency of vibration, then

$$\alpha = \omega^2 A \quad \ldots(i)$$

and $\beta = \omega A \quad \ldots(ii)$

Dividing eqn. (i) by eqn. (ii), we get

$$\frac{\alpha}{\beta} = \frac{\omega^2 A}{\omega A} = \omega$$

$\therefore$ Time period of vibration is

$$T = \frac{2\pi}{\omega} = \frac{2\pi}{(\alpha/\beta)} = \frac{2\pi\beta}{\alpha}$$

3. **(d)** : In SHM, velocities of a particle at distances x_1 and x_2 from mean position are given by

$$V_1^2 = \omega^2(a^2 - x_1^2) \quad \ldots(i)$$

$$V_2^2 = \omega^2(a^2 - x_2^2) \quad \ldots(ii)$$

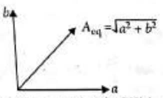
From equations (i) and (ii), we get

$$V_1^2 - V_2^2 = \omega^2(x_2^2 - x_1^2)$$

$$\omega = \sqrt{\frac{V_1^2 - V_2^2}{x_2^2 - x_1^2}} \quad \therefore \quad T = 2\pi\sqrt{\frac{x_2^2 - x_1^2}{V_1^2 - V_2^2}}$$

4. **(a)** : Here, $y_1 = a\sin\omega t$

$y_2 = b\cos\omega t = b\sin\left(\omega t + \dfrac{\pi}{2}\right)$



Hence, resultant motion is SHM with amplitude $\sqrt{a^2 + b^2}$.

5. **(c)**: Here, $X = A\cos\omega t$

$\therefore$ Velocity, $v = \dfrac{dX}{dt} = \dfrac{d}{dt}(A\cos\omega t)$
$= -A\omega\sin\omega t$

Acceleration, $a = \dfrac{dv}{dt} = \dfrac{d}{dt}(-A\omega\sin\omega t)$
$= -A\omega^2\cos\omega t$

Hence the variation of a with t is correctly shown by graph (c).

6. **(c)** : $x = a\sin\omega t$ or $\dfrac{x}{a} = \sin\omega t \quad \ldots(i)$

Velocity, $v = \dfrac{dx}{dt} = a\omega\cos\omega t$

$$\frac{v}{a\omega} = \cos\omega t \quad \ldots(ii)$$

Squaring and adding (i) and (ii), we get

$$\frac{x^2}{a^2} + \frac{v^2}{a^2\omega^2} = \sin^2\omega t + \cos^2\omega t$$

$$\frac{x^2}{a^2} + \frac{v^2}{a^2\omega^2} = 1$$

It is an equation of ellipse.
Hence, the graph between velocity and displacement is an ellipse.
Momentum of the particle $= mv$
$\therefore$ The nature of graph of the momentum and displacement is same as that of velocity and displacement.

7. **(c)** : $y = \sin\omega t - \cos\omega t$

$$= \sqrt{2}\left[\frac{1}{\sqrt{2}}\sin\omega t - \frac{1}{\sqrt{2}}\cos\omega t\right] = \sqrt{2}\sin\left(\omega t - \frac{\pi}{4}\right)$$

It represents a SHM with time period, $T = \dfrac{2\pi}{\omega}$.

$$y = \sin^3\omega t = \frac{1}{4}[3\sin\omega t - \sin 3\omega t]$$

It represents a periodic motion with time period $T = \frac{2\pi}{\omega}$ but not SHM.

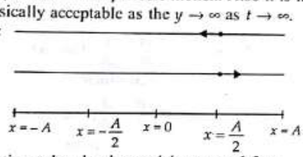
$$y = 5\cos\left(\frac{3\pi}{4} - 3\omega t\right)$$
$$= 5\cos\left(3\omega t - \frac{3\pi}{4}\right) \quad [\because \cos(-\theta) = \cos\theta]$$

It represents a SHM with time period, $T = \frac{2\pi}{3\omega}$.

$y = 1 + \omega t + \omega^2 t^2$

It represents a non-periodic motion. Also it is not physically acceptable as the $y \to \infty$ as $t \to \infty$.

8. (c) :



The time taken by the particle to travel from $x = 0$ to $x = \frac{A}{2}$ is $\frac{T}{12}$.

The time taken by the particle to travel from $x = A$ to $x = \frac{A}{2}$ is $\frac{T}{6}$.

Time difference $= \frac{T}{6} + \frac{T}{6} = \frac{T}{3}$

Phase difference, $\phi = \frac{2\pi}{T} \times \text{Time difference}$

$$= \frac{2\pi}{T} \times \frac{T}{3} = \frac{2\pi}{3}$$

9. (c) : $x = a\sin^2\omega t$

$$= a\left(\frac{1 - \cos 2\omega t}{2}\right) \quad (\because \cos 2\theta = 1 - 2\sin^2\theta)$$
$$= \frac{a}{2} - \frac{a\cos 2\omega t}{2}$$

$\therefore$ Velocity, $v = \frac{dx}{dt} = \frac{2\omega a \sin 2\omega t}{2} = \omega a \sin 2\omega t$

Acceleration, $a = \frac{dv}{dt} = 2\omega^2 a\cos 2\omega t$

For the given displacement $x = a\sin^2\omega t$,

$a \propto -x$ is not satisfied.

Hence, the motion of the particle is non simple harmonic motion.

Note : The given motion is a periodic motion with a time period

$$T = \frac{2\pi}{2\omega} = \frac{\pi}{\omega}$$

10. (d) : A mass M is suspended from a massless spring of spring constant k as shown in figure (a). Then, Time period of oscillation is

$$T = 2\pi\sqrt{\frac{M}{k}}$$

When a another mass M is also suspended with it as shown in figure (b). Then,

Time period of oscillation is

$$T' = 2\pi\sqrt{\frac{M+M}{k}} = 2\pi\sqrt{\frac{2M}{k}}$$
$$= \sqrt{2}\left(2\pi\sqrt{\frac{M}{k}}\right) = \sqrt{2}\,T \quad \text{(Using}$$

11. (c) : For simple harmonic motion, $v = \omega\sqrt{a^2 - x^2}$. When $x = \frac{a}{2}$,

When $x = \frac{a}{2}$, $v = \omega\sqrt{a^2 - \frac{a^2}{4}} = \omega\sqrt{\frac{3}{4}a^2}$.

As $\omega = \frac{2\pi}{T}$, $\therefore v = \frac{2\pi}{T}\cdot\frac{\sqrt{3}}{2}a \Rightarrow v = \frac{\pi\sqrt{3}a}{T}$

12. (*) : Simple harmonic motion is defined as follow

Acceleration $\frac{d^2y}{dt^2} = -\omega^2 x$

The negative sign is very important in simple harmonic motion. Acceleration is independent of any initial displacement of equilibrium position. Then acceleration $= -\omega^2 x$.

* Option not given.

13. (d) : $\omega_1 = 100$ rad s^{-1}; $\omega_2 = 1000$ rad s^{-1}.

Maximum acceleration of (1) $= -\omega_1^2 A$

Maximum acceleration of (2) $= -\omega_2^2 A$

$$\therefore \frac{\text{acceln (1)}}{\text{acceln (2)}} = \frac{\omega_1^2}{\omega_2^2} = \frac{(100)^2}{(1000)^2} = \frac{1}{100}$$

$a(1) : a(2) = 1 : 100$.

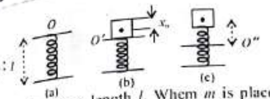
14. (b) : $x(t) = a\sin\omega t$ (from the equilibrium position)

At $x(t) = a/2$

$$\therefore \frac{a}{2} = a\sin(\omega t)$$
$$\Rightarrow \sin\left(\frac{\pi}{6}\right) = \sin(\omega t) \quad \text{or,} \quad \frac{\pi}{6} = \frac{2\pi t}{T} \quad \left[\because \omega = \frac{2\pi}{T}\right]$$

or $t = T/12$.

15. (a) :



The spring has a length l. Whem m is placed over it, the equilibrium position becomes O'. If it is pressed from O' (the equilibrium position) to O'', $O'O''$ is the amplitude.

$$OO' = \frac{mg}{k} = \frac{2 \times 10}{200} = 0.10 \text{ m.}$$

$mg = kx_0$.

If the restoring force $mA\omega^2 > mg$, then the mass will move up with acceleration, detached from the pan.

i.e. $A > \frac{g}{k/m} \Rightarrow A > \frac{20}{200} > 0.10$ m.

The amplitude > 10 cm.

i.e. the minimum is just greater than 10 cm. (The actual compression will include x_0 also. But when talking of amplitude, it is always from the equilibrium position with respect to which the mass is oscillating.

16. (c) : Kinetic energy + potential energy = total energy

When kinetic energy is maximum, potential energy is zero and vice versa.

$\therefore$ Maximum potential energy = total energy.

$0 + K_0 = K_0$

(K.E. + P.E. = total energy).

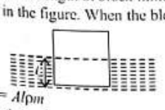
17. (d) : Let $y = A\sin\omega t$

$$\frac{dy}{dt} = A\omega\cos\omega t = A\omega\sin\left(\omega t + \frac{\pi}{2}\right)$$

Acceleration $= -A\omega^2\sin\omega t$

The phase difference between acceleration and velocity is $\pi/2$.

18. (c) : Let l be the length of block immersed in liquid as shown in the figure. When the block is floating.



$\therefore mg = Al\rho g$

If the block is given vertical displacement y then the effective restoring force is

$$F = -[A(l + y)\rho g - mg) = -[A(l + y)\rho g - Al\rho g]$$
$$= -A\rho g y$$

Restoring force $= -[A\rho g]y$. As this F is directed towards its equilibrium position of block, so if the block is left free, it will execute simple harmonic motion.

Here inertia factor = mass of block = m

Spring factor = $A\rho g$

$\therefore$ Time period $= T = 2\pi\sqrt{\frac{m}{A\rho g}}$

i.e. $T \propto \frac{1}{\sqrt{A}}$.

19. (a) : Periodic

20. (d) : $a = 5$ cm, $v_{max} = 31.4$ cm/s

$v_{max} = \omega a \Rightarrow 31.4 = 2\pi\upsilon \times 5$

$\Rightarrow 31.4 = 10 \times 3.14 \times \upsilon \Rightarrow \upsilon = 1$ Hz.

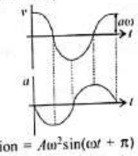
21. (d) : When the spring joined in series the total extension in spring is

$$\Rightarrow y = y_1 + y_2 = \frac{-F}{k_1} - \frac{F}{k_2}$$
$$\Rightarrow y = -F\left[\frac{1}{k_1} + \frac{1}{k_2}\right]$$

Thus spring constant in this case becomes

$$\Rightarrow k = \frac{k_1 k_2}{k_1 + k_2}$$

22. (d) : In simple harmonic motion velocity $= A\omega\sin(\omega t + \pi/2)$



acceleration $= A\omega^2\sin(\omega t + \pi)$ from this we can easily find out that when v is maximum, then a is zero.

23. (c) : Potential energy of simple harmonic oscillator

$$= \frac{1}{2}m\omega^2 y^2$$

for $y = \frac{a}{2}$, P.E. $= \frac{1}{2}m\omega^2\frac{a^2}{4}$

$$\Rightarrow \text{P.E.} = \frac{1}{4}\left(\frac{1}{2}m\omega^2 a^2\right) = \frac{E}{4}.$$

24. (a) : Potential energy of particle performing SHM varies parabolically in such a way that at mean

position it becomes zero and maximum at extreme position.

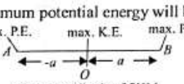
25. **(c)** : Let k be the force constant of spring. If k' is the force constant of each part, then

$$\frac{1}{k} = \frac{4}{k'} \Rightarrow k' = 4k.$$

$\therefore$ Time period $= 2\pi\sqrt{\frac{m}{4k}} = \frac{1}{2} \times 2\pi\sqrt{\frac{m}{k}} = \frac{T}{2}.$

26. **(a)** : Smaller damping gives a taller and narrower resonance peak.

27. **(c)** : For a simple harmonic motion between A and B, with O as the mean position, maximum kinetic energy of the particle executing SHM will be at O and maximum potential energy will be at A and B.



a is the amplitude of SHM

$\therefore$ Displacement between maximum potential energy and maximum kinetic energy is $\pm a$.

28. **(d)** : This is a case of damped vibration as the amplitude of vibration is decreasing with time. Amplitude of vibrations at any instant t is given by $a = a_0 e^{-bt}$, where a_0 is the initial amplitude of vibrations and b is the damping constant.

Now, when $t = 100T$, $a = a_0/3$ [T is time period]

Let the amplitude be a' at $t = 200T$.

i.e. after completing 200 oscillations.

$\therefore \quad a = a_0/3 = a_0 e^{-100Tb}$ ...(i)

and $a' = a_0 e^{-200Tb}$ ...(ii)

From (i), $\frac{1}{3} = e^{-100Tb}$. $\therefore \quad e^{-200Tb} = 1/9.$

From (ii), $a' = a_0 \times \frac{1}{9} = \frac{a_0}{9}$.

$\therefore$ The amplitude will be reduced to 1/9 of initial value.

29. **(b)** : The time period of a spring mass system as shown in figure 1 is given by $T = 2\pi\sqrt{m/k}$, where k is the spring constant.

Figure 1

$\therefore \quad t_1 = 2\pi\sqrt{m/k_1}$ ...(i)

and $t_2 = 2\pi\sqrt{m/k_2}$ ...(ii)

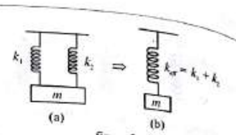


figure 2

Now, when they are connected in parallel as shown in figure 2(a), the system can be replaced by a single spring of spring constant, $k_{eff} = k_1 + k_2$

[Since $mg = k_1 x + k_2 x = k_{eff} x$]

$\therefore \quad t_0 = 2\pi\sqrt{m/k_{eff}} = 2\pi\sqrt{m/(k_1+k_2)}$

From (i), $\frac{1}{t_1^2} = \frac{1}{4\pi^2} \times \frac{k_1}{m}$

From (ii), $\frac{1}{t_2^2} = \frac{1}{4\pi^2} \times \frac{k_2}{m}$

From (iii), $\frac{1}{t_0^2} = \frac{1}{4\pi^2} \times \frac{k_1 + k_2}{m}$

(iv) + (v) $= \frac{1}{t_1^2} + \frac{1}{t_2^2} = \frac{1}{4\pi^2 m}(k_1 + k_2) = \frac{1}{t_0^2}$

$\therefore \quad t_0^{-2} = t_1^{-2} + t_2^{-2}.$

30. **(b)** : Energy $= \frac{1}{2} m\omega^2 a^2 = \frac{1}{2} k a^2$

31. **(a)** : $f_A = 2f_B$

$\Rightarrow \quad \frac{1}{2\pi}\sqrt{\frac{g}{l_A}} = 2 \times \frac{1}{2\pi}\sqrt{\frac{g}{l_B}}$

or, $\quad \frac{1}{l_A} = 4 \times \frac{1}{l_B}$.

or, $\quad l_A = \frac{l_B}{4}$, which does not depend on mass.

32. **(a)** : In ΔOAC, $\cos\theta = A/l$

or, $\quad OA = l\cos\theta$

$\therefore \quad AB = l(1 - \cos\theta) = h$

At point, C the velocity of bob $= 0$.

The vertical acceleration $= g$

$\therefore \quad v^2 = 2gh$ or, $v = \sqrt{2gl(1-\cos\theta)}$.

33. **(d)** : Time period of a simple pendulum is given by $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow T \propto \sqrt{l}$.

$\therefore \quad \frac{T_1}{T_2} = \sqrt{\frac{l_1}{l_2}} = \sqrt{\frac{1}{4}} = \frac{1}{2}$ or, $T_2 = 2T_1 = 4$ sec

34. **(b)** : The amplitude and velocity resonance occurs at the same frequency.

At resonance, i.e., $\omega_1 = \omega_0$ and $\omega_2 = \omega_0$ the amplitude and energy of the particle would be maximum.

35. **(a)** : Frequency of the pendulum $\upsilon_{l=5} = \frac{1}{2\pi}\sqrt{\frac{g}{5}}$

$\upsilon_{l=20} = \frac{1}{2\pi}\sqrt{\frac{g}{20}}$

$\therefore \quad \frac{\upsilon_{l=5}}{\upsilon_{l=20}} = \sqrt{\frac{20}{5}} = 2 \Rightarrow \upsilon_{l=5} = 2\upsilon_{l=20}$

As shorter length pendulum has frequency double the larger length pendulum. Therefore shorter pendulum should complete 2 oscillations before they will be again in phase.

36. **(a)** : $n = \frac{1}{2\pi}\sqrt{\frac{k}{m}}$; $\quad n' = \frac{1}{2\pi}\sqrt{\frac{k}{4m}}$

$\therefore n' = n/2$

37. **(a)** : $l_2 = 1.02 l_1$. Time period $(T) = 2\pi \times \sqrt{\frac{l}{g}} \propto \sqrt{l}$

Therefore $\frac{T_2}{T_1} = \sqrt{\frac{l_2}{l_1}} = \sqrt{\frac{1.02 l_1}{l_1}} = 1.01$. Thus time period increased by 1%.

38. **(c)** : $x = a\sin\omega t$

$y = a\sin(\omega t + \pi/2) = a\cos\omega t$

or, $\frac{x}{y} = \frac{\sin\omega t}{\cos\omega t} = \tan\omega t$ or, $\frac{x}{y} = \frac{x}{\sqrt{a^2 - x^2}}$,

or, $y^2 = a^2 - x^2$ or, $x^2 + y^2 = a^2$.

It is an equation of a circle.

39. **(d)** : Maximum velocity, $v_{max} = A\omega$

According to question, $\frac{v_{max}}{2} = \frac{A\omega}{2} = \omega\sqrt{A^2 - y^2}$

$\frac{A^2}{4} = A^2 - y^2 \Rightarrow y^2 = A^2 - \frac{A^2}{4} \Rightarrow y = \frac{\sqrt{3}A}{2}$.

40. **(c)** : Force constant $(k) = 2 \times 10^6$ N/m; Amplitude $(x) = 0.01$ m and total mechanical energy = 160 J.

Potential energy $= \frac{1}{2}k x^2 = \frac{1}{2} \times (2 \times 10^6) \times (0.01)^2$

$= 100$ J.

41. **(b)** : Potential energy at A (or C) = Kinetic energy at B. Thus $\frac{1}{2} m v_B^2 = mgH$ or $v_B = \sqrt{2gH}$.

42. **(b)** : Displacement $(x) = \frac{a}{2}$. Total energy $= \frac{1}{2} m\omega^2 a^2$ and kinetic energy when displacement is (x)

$= \frac{1}{2} m\omega^2 (a^2 - x^2)$

$= \frac{1}{2} m\omega^2 \left(a^2 - \left(\frac{a}{2}\right)^2\right) = \frac{3}{4}\left(\frac{1}{2} m\omega^2 a^2\right)$.

Therefore fraction of the total energy at

$$x = \frac{\frac{3}{4}\left(\frac{1}{2} m\omega^2 a^2\right)}{\frac{1}{2} m\omega^2 a^2} = \frac{3}{4}.$$

43. **(d)** : Mass $(m) = 5$ kg and time period $(T) = 2\pi$ sec.

Therefore time period $T = 2\pi \times \sqrt{\frac{m}{k}} \Rightarrow \sqrt{\frac{5}{k}} = 1$ or $k = 5$ N/m. According to Hooke's Law, $F = -kl$.

Therefore decrease in length $(l) = -\frac{F}{k} = -\frac{5g}{5}$

$= -g$ metres

44. **(d)** : For simple harmonic motion, $\frac{d^2x}{dt^2} \propto -x$.

Therefore force acting on the particle $= -Akx$.

45. **(d)** : Period of oscillation $T = 2\pi\sqrt{\frac{l}{g}}$. Therefore T will decrease when acceleration (g) increases. And g will increase when the rocket moves up with a uniform acceleration.

46. **(a)** : Time period = 4 sec. In one simple harmonic oscillation, the same kinetic and potential energies are repeated two times. So the difference will be 2 seconds.

47. **(b)** : P.E $= \frac{1}{2} M\omega^2 x^2 = \frac{1}{4} E = \frac{1}{4}\left(\frac{1}{2} M\omega^2 A^2\right)$

where total energy $E = \frac{1}{2} M\omega^2 A^2 \quad \therefore x = \frac{A}{2}$

48. **(a)** : For S.H.M., $x = A\sin\left(\frac{2\pi}{T}t\right)$

when $x = A$, $A = A\sin\left(\frac{2\pi}{T}t\right)$

$\therefore \quad \sin\left(\frac{2\pi}{T} \cdot t\right) = 1 \Rightarrow \sin\left(\frac{2\pi}{T} \cdot t\right) = \sin\left(\frac{\pi}{2}\right)$

$\Rightarrow \quad t = (T/4)$

When $x = \frac{A}{2}, \frac{A}{2} = A\sin\left(\frac{2\pi}{T}.t\right)$

or $\sin\frac{\pi}{6} = \sin\left(\frac{2\pi}{T}t\right)$ or $t = (T/12)$

Now, time taken to travel from $x = A$ to $x = A/2 = T/4 - T/12 = T/6$

49. **(a) :** Acceleration = $-\omega^2$ displacement

$$\omega^2 = \frac{\text{acceleration}}{\text{displacement}} = \frac{2.0}{0.02}$$

$\omega^2 = 100$ or $\omega = 10$ rad/s

50. **(d) :** The effective value of acceleration due to gravity is $\sqrt{(a^2 + g^2)}$

51. **(c) :** For simple harmonic motion velocity $v = \omega\sqrt{a^2 - x^2}$ at displacement x.

$$10 = \omega\sqrt{a^2 - 16} \quad \text{...(i)}$$

$$8 = \omega\sqrt{a^2 - 25} \quad \text{...(ii)}$$

$$\frac{100}{\omega^2} = a^2 - 16 \quad \text{...(iii)}$$

$$\frac{64}{\omega^2} = a^2 - 25 \quad \text{...(iv)}$$

$\therefore$ Equation (iii) – (iv) gives $\frac{36}{\omega^2} = 9$

$\Rightarrow$ $\omega = 2$ rad/s

or $T = \frac{2\pi}{\omega} = \frac{2\pi}{2} = \pi$ sec

52. **(c) :** P.E, $V = \frac{1}{2}m\omega^2x^2$

and KE, $T = \frac{1}{2}m\omega^2(a^2 - x^2)$

$\therefore$ $\frac{T}{V} = \frac{a^2 - x^2}{x^2}$

53. **(c) :** $x = a\sin\omega t$

and $y = b\sin(\omega t + \pi) = -b\sin\omega t$.

or $\frac{x}{a} = -\frac{y}{b}$ or $y = -\frac{b}{a}x$

It is an equation of a straight line

54. **(d) :** The effective spring constant of two spring in series is $k = \frac{k_1k_2}{k_1 + k_2}$

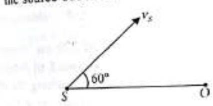
Time period, $T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{m(k_1 + k_2)}{k_1k_2}}$

CHAPTER 11

Waves

1. 4.0 g of a gas occupies 22.4 litres at NTP. The specific heat capacity of the gas at constant volume is 5.0 JK^{-1} mol^{-1}. If the speed of sound in this gas at NTP is 952 ms^{-1}, then the heat capacity at constant pressure is
(Take gas constant $R = 8.3$ JK^{-1} mol^{-1})
(a) 7.0 $JK^{-1}mol^{-1}$ (b) 8.5 $JK^{-1}mol^{-1}$
(c) 8.0 $JK^{-1}mol^{-1}$ (d) 7.5 $JK^{-1}mol^{-1}$
(AIPMT 2015)

2. A source of sound S emitting waves of frequency 100 Hz and an observer O are located at some distance from each other. The source is moving with a speed of 19.4 ms^{-1} at an angle of 60° with the source observer line as shown in the figure.



The observer is at rest.
The apparent frequency observed by the observer (velocity of sound in air 330 ms^{-1}), is
(a) 106 Hz (b) 97 Hz
(c) 100 Hz (d) 103 Hz
(AIPMT 2015)

3. The fundamental frequency of a closed organ pipe of length 20 cm is equal to the second overtone of an organ pipe open at both the ends. The length of organ pipe open at both the ends is
(a) 120 cm (b) 140 cm
(c) 80 cm (d) 100 cm
(AIPMT 2015, Cancelled)

4. If n_1, n_2 and n_3 are the fundamental frequencies of three segments into which a string is divided, then the original fundamental frequency n of the string is given by
(a) $\frac{1}{n} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3}$
(b) $\frac{1}{\sqrt{n}} = \frac{1}{\sqrt{n_1}} + \frac{1}{\sqrt{n_2}} + \frac{1}{\sqrt{n_3}}$
(c) $\sqrt{n} = \sqrt{n_1} + \sqrt{n_2} + \sqrt{n_3}$
(d) $n = n_1 + n_2 + n_3$
(AIPMT 2014)

5. The number of possible natural oscillations of air column in a pipe closed at one end of length 85 cm whose frequencies lie below 1250 Hz are (Velocity of sound = 340 m s^{-1})
(a) 4 (b) 5
(c) 7 (d) 6
(APMT 2014)

6. A speeding motorcyclist sees traffic jam ahead him. He slows down to 36 km $hour^{-1}$. He finds that traffic has eased and a car moving ahead of him at 18 km $hour^{-1}$ is honking at a frequency of 1392 Hz. If the speed of sound is 343 m s^{-1}, the frequency of the honk as heard by him will be
(a) 1332 Hz (b) 1372 Hz
(c) 1412 Hz (d) 1454 Hz
(AIPMT 2014)

7. If we study the vibration of a pipe open at both ends, then the following statement is not true.
(a) All harmonics of the fundamental frequency will be generated.
(b) Pressure change will be maximum at both ends.
(c) Open end will be antinode.
(d) Odd harmonics of the fundamental frequency will be generated.
(NEET 2013)

8. A wave travelling in the +ve x-direction having displacement along y-direction as 1 m, wavelength 2π m and frequency of $\frac{1}{\pi}$ Hz is represented by

(a) $y = \sin(10\pi x - 20\pi t)$
(b) $y = \sin(2\pi x + 2\pi t)$
(c) $y = \sin(x - 2t)$
(d) $y = \sin(2\pi x - 2\pi t)$ *(NEET 2013)*

9. A source of unknown frequency gives 4 beats/s when sounded with a source of known frequency 250 Hz. The second harmonic of the source of unknown frequency gives five beats per second, when sounded with a source of frequency 513 Hz. The unknown frequency is
(a) 240 Hz (b) 260 Hz
(c) 254 Hz (d) 246 Hz
(NEET 2013)

10. The length of the wire between two ends of a sonometer is 100 cm. What should be the positions of two bridges below the wire so that the three segments of the wire have their fundamental frequencies in the ratio 1 : 3 : 5.
(a) $\frac{1500}{23}$ cm, $\frac{500}{23}$ cm (b) $\frac{1500}{23}$ cm, $\frac{300}{23}$ cm
(c) $\frac{300}{23}$ cm, $\frac{1500}{23}$ cm (d) $\frac{1500}{23}$ cm, $\frac{2000}{23}$ cm
(Karnataka NEET 2013)

11. Two sources P and Q produce notes of frequency 660 Hz each. A listener moves from P to Q with a speed of 1 ms^{-1}. If the speed of sound is 330 m/s, then the number of beats heard by the listener per second will be
(a) 4 (b) 8
(c) 2 (d) zero
(Karnataka NEET 2013)

12. When a string is divided into three segments of length l_1, l_2 and l_3 the fundamental frequencies of these three segments are υ_1, υ_2, and υ_3 respectively. The original fundamental frequency (υ) of the string is
(a) $\sqrt{\upsilon} = \sqrt{\upsilon_1} + \sqrt{\upsilon_2} + \sqrt{\upsilon_3}$
(b) $\upsilon = \upsilon_1 + \upsilon_2 + \upsilon_3$
(c) $\frac{1}{\upsilon} = \frac{1}{\upsilon_1} + \frac{1}{\upsilon_2} + \frac{1}{\upsilon_3}$
(d) $\frac{1}{\sqrt{\upsilon}} = \frac{1}{\sqrt{\upsilon_1}} + \frac{1}{\sqrt{\upsilon_2}} + \frac{1}{\sqrt{\upsilon_3}}$
(Prelims 2012)

13. Two sources of sound placed close to each other are emitting progressive waves given by
$y_1 = 4\sin 600\pi t$ and $y_2 = 5\sin 608\pi t$
An observer located near these two sources of sound will hear
(a) 4 beats per second with intensity ratio 25 : 16 between waxing and waning.
(b) 8 beats per second with intensity ratio 25 : 16 between waxing and waning.
(c) 8 beats per second with intensity ratio 81 : 1 between waxing and waning.
(d) 4 beats per second with intensity ratio 81 : 1 between waxing and waning.
(Prelims 2012)

14. The equation of a simple harmonic wave is given by

$$y = 3\sin\frac{\pi}{2}(50t - x),$$

where x and y are in metres and t is in seconds. The ratio of maximum particle velocity to the wave velocity is
(a) 2π (b) $\frac{3}{2}\pi$
(c) 3π (d) $\frac{2}{3}\pi$ *(Mains 2012)*

15. A train moving at a speed of 220 ms^{-1} towards a stationary object, emits a sound of frequency 1000 Hz. Some of the sound reaching the object gets reflected back to the train as echo. The frequency of the echo as detected by the driver of the train is
(Speed of sound in air is 330 ms^{-1})
(a) 3500 Hz (b) 4000 Hz
(c) 5000 Hz (d) 3000 Hz
(Mains 2012)

16. Two waves are represented by the equations
$y_1 = a\sin(\omega t + kx + 0.57)$ m and
$y_2 = a\cos(\omega t + kx)$ m, where x is in meter and t in sec. The phase difference between them is
(a) 1.0 radian (b) 1.25 radian
(c) 1.57 radian (d) 0.57 radian
(Prelims 2011)

17. Sound waves travel at 350 m/s through a warm air and at 3500 m/s through brass. The wavelength of a 700 Hz acoustic wave as it enters brass from warm air

(a) decrease by a factor 10
(b) increase by a factor 20
(c) increase by a factor 10
(d) decrease by a factor 20 *(Prelims 2011)*

18. Two identical piano wires, kept under the same tension T have a fundamental frequency of 600 Hz. The fractional increase in the tension of one of the wires which will lead to occurrence of 6 beats/s when both the wires oscillate together would be
(a) 0.01 (b) 0.02
(c) 0.03 (d) 0.04 *(Mains 2011)*

19. A transverse wave is represented by $y = A\sin(\omega t - kx)$. For what value of the wavelength is the wave velocity equal to the maximum particle velocity?
(a) $\pi A/2$ (b) πA
(c) $2\pi A$ (d) A
(Prelims 2010)

20. A tuning fork of frequency 512 Hz makes 4 beats per second with the vibrating string of a piano. The beat frequency decreases to 2 beats per sec when the tension in the piano string is slightly increased. The frequency of the piano string before increasing the tension was
(a) 510 Hz (b) 514 Hz
(c) 516 Hz (d) 508 Hz
(Prelims 2010)

21. Each of the two strings of length 51.6 cm and 49.1 cm are tensioned separately by 20 N force. Mass per unit length of both the strings is same and equal to 1 g/m. When both the strings vibrate simultaneously the number of beats is
(a) 7 (b) 8
(c) 3 (d) 5 *(Prelims 2009)*

22. The driver of a car travelling with speed 30 m/sec towards a hill sounds a horn of frequency 600 Hz. If the velocity of sound in air is 330 m/s, the frequency of reflected sound as heard by driver is
(a) 555.5 Hz (b) 720 Hz
(c) 500 Hz (d) 550 Hz
(Prelims 2009)

23. A wave in a string has an amplitude of 2 cm. The wave travels in the +ve direction of x axis with a speed of 128 m/sec. and it is noted that

5 complete waves fit in 4 m length of the string. The equation describing the wave is
(a) $y = (0.02)$ m $\sin(15.7x - 2010t)$
(b) $y = (0.02)$ m $\sin(15.7x + 2010t)$
(c) $y = (0.02)$ m $\sin(7.85x - 1005t)$
(d) $y = (0.02)$ m $\sin(7.85x + 1005t)$
(Prelims 2009)

24. A point performs simple harmonic oscillation of period T and the equation of motion is given by $x = a\sin(\omega t + \pi/6)$. After the elapse of what fraction of the time period the velocity of the point will be equal to half of its maximum velocity?
(a) $T/3$ (b) $T/12$
(c) $T/8$ (d) $T/6$ *(Prelims 2008)*

25. Two periodic waves of intensities I_1 and I_2 pass through a region at the same time in the same direction. The sum of the maximum and minimum intensities is
(a) $(\sqrt{I_1} - \sqrt{I_2})^2$ (b) $2(I_1 + I_2)$
(c) $I_1 + I_2$ (d) $(\sqrt{I_1} + \sqrt{I_2})^2$
(Prelims 2008)

26. The wave described by $y = 0.25\sin(10\pi x - 2\pi t)$, where x and y are in meters and t in seconds, is a wave travelling along the
(a) +ve x direction with frequency 1 Hz and wavelength $\lambda = 0.2$ m.
(b) –ve x direction with amplitude 0.25 m and wavelength $\lambda = 0.2$ m.
(c) –ve x direction with frequency 1 Hz.
(d) +ve x direction with frequency p Hz and wavelength $\lambda = 0.2$ m.
(Prelims 2008)

27. Two vibrating tuning forks produce waves given by $y_1 = 4\sin 500\pi t$ and $y_2 = 2\sin 506\pi t$. Number of beats produced per minute is
(a) 360 (b) 180
(c) 60 (d) 3 *(2006)*

28. Two sound waves with wavelengths 5.0 m and 5.5. m respectively, each propagate in a gas with velocity 330 m/s. We expect the following number of beats per second.
(a) 6 (b) 12
(c) 0 (d) 1. *(2006)*

29. The time of reverberation of a room A is one second. What will be the time (in seconds) of reverberation of a room, having all the dimensions double of those of room A?

(a) 1 (b) 2
(c) 4 (d) 1/2. *(2006)*

30. A transverse wave propagating along x-axis is represented by $y(x, t) = 8.0\sin(0.5\pi x - 4\pi t - \pi/4)$ where x is in metres and t is in seconds. The speed of the wave is

(a) 8 m/s (b) 4π m/s
(c) 0.5π m/s (d) $\pi/4$ m/s. *(2006)*

31. Which one of the following statements is true?

(a) both light and sound waves can travel in vacuum
(b) both light and sound waves in air are transverse
(c) the sound waves in air are longitudinal while the light waves are transverse
(d) both light and sound waves in air are longitudinal. *(2006)*

32. A point source emits sound equally in all directions in a non-absorbing medium. Two points P and Q are at distances of 2 m and 3 m respectively from the source. The ratio of the intensities of the waves at P and Q is

(a) 3 : 2 (b) 2 : 3
(c) 9 : 4 (d) 4 : 9. *(2005)*

33. The phase difference between two waves, represented by

$y_1 = 10^{-6}\sin[100t + (x/50) + 0.5]$ m
$y_2 = 10^{-6}\cos[100t + (x/50)]$ m.

where x is expressed in metres and t is expressed in seconds, is approximately.

(a) 1.07 radians (b) 2.07 radians
(c) 0.5 radians (d) 1.5 radians *(2004)*

34. A car is moving towards a high cliff. The driver sounds a horn of frequency f. The reflected sound heard by the driver has frequency $2f$. If v is the velocity of sound, then the velocity of the car, in the same velocity units, will be

(a) $v/\sqrt{2}$ (b) $v/3$
(c) $v/4$ (d) $v/2$ *(2004)*

35. An observer moves towards a stationary source of sound with a speed 1/5th of the speed of sound. The wavelength and frequency of the source emitted are λ and f respectively. The apparent frequency and wavelength recorded by the observer are respectively

(a) $1.2f, 1.2\lambda$ (b) $1.2f, \lambda$
(c) $f, 1.2\lambda$ (d) $0.8f, 0.8\lambda$ *(200*

36. A whistle revolves in a circle with angular speed $\omega = 20$ rad/sec using a string of length 50 cm. If the frequency of sound from the whistle is 385 Hz, then what is the minimum frequency heard by an observer which is far away from the centre (velocity of sound = 340 m/s)

(a) 385 Hz (b) 374 Hz
(c) 394 Hz (d) 333 Hz. *(200*

37. A wave travelling in positive X-direction with $a = 0.2$ mt., velocity = 360 mt/sec. and $\lambda = 60$ mts, then correct expression for the wave is

(a) $y = 0.2\sin\left[2\pi\left(6t + \frac{x}{60}\right)\right]$

(b) $y = 0.2\sin\left[\pi\left(6t + \frac{x}{60}\right)\right]$

(c) $y = 0.2\sin\left[2\pi\left(6t - \frac{x}{60}\right)\right]$

(d) $y = 0.2\sin\left[\pi\left(6t - \frac{x}{60}\right)\right]$. *(200*

38. The equation of a wave is represented by $y = 10^{-4}\sin\left(100t - \frac{x}{10}\right)$ m, then the velocity of wave will be

(a) 100 m/s (b) 4 m/s
(c) 1000 m/s (d) 10 m/s. *(200*

39. Two waves having equation $x_1 = a\sin(\omega t - kx + \phi_1)$, $x_2 = a\sin(\omega t - kx + \phi_2)$. If in the resultant wave the frequency and amplitude remain equal to amplitude of superimposing waves, the phase difference between them is

(a) $\frac{\pi}{6}$ (b) $\frac{2\pi}{3}$
(c) $\frac{\pi}{4}$ (d) $\frac{\pi}{3}$. *(200*

40. If the tension and diameter of a sonometer wire of fundamental frequency n is doubled and density is halved then its fundamental frequency will become

(a) $\frac{n}{4}$ (b) $\sqrt{2}n$
(c) n (d) $\frac{n}{\sqrt{2}}$. *(200*

41. The equations of two waves acting in perpendicular directions are given as $x = a\cos(\omega t + \delta)$ and $y = a\cos(\omega t + \alpha)$, where $\delta = \alpha + \frac{\pi}{2}$, the resultant wave represents

(a) a parabola (b) a circle
(c) an ellipse (d) a straight line *(2000)*

42. A string is cut into three parts, having fundamental frequencies n_1, n_2, n_3 respectively. Then original fundamental frequency n related by the expression as

(a) $\frac{1}{n} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3}$ (b) $n = n_1 \times n_2 \times n_3$

(c) $n = n_1 + n_2 + n_3$ (d) $n = \frac{n_1 + n_2 + n_3}{3}$. *(2000)*

43. Two stationary sources each emitting waves of wavelength λ, an observer moves from one source to another with velocity u. Then number of beats heard by him

(a) $\frac{2u}{\lambda}$ (b) $\frac{u}{\lambda}$
(c) $\sqrt{u\lambda}$ (d) $\frac{u}{2\lambda}$. *(2000)*

44. Two waves of lengths 50 cm and 51 cm produced 12 beats per sec. The velocity of sound is

(a) 340 m/s (b) 331 m/s
(c) 306 m/s (d) 360 m/s *(1999)*

45. A transverse wave is represented by the equation

$y = y_0 \sin\frac{2\pi}{\lambda}(vt - x)$

For what value of λ, is the maximum particle velocity equal to two times the wave velocity?

(a) $\lambda = \frac{\pi y_0}{2}$ (b) $\lambda = \frac{\pi y_0}{3}$
(c) $\lambda = 2\pi y_0$ (d) $\lambda = \pi y_0$ *(1998)*

46. A vehicle, with a horn of frequency n is moving with a velocity of 30 m/s in a direction perpendicular to the straight line joining the observer and the vehicle. The observer perceives the sound to have a frequency $n + n_1$. Then (if the sound velocity in air is 300 m/s)

(a) $n_1 = 0.1n$ (b) $n_1 = 0$
(c) $n_1 = 10n$ (d) $n_1 = -0.1\,n$ *(1998)*

47. A standing wave having 3 nodes and 2 antinodes is formed between two atoms having a distance 1.21 Å between them. The wavelength of the standing wave is

(a) 6.05 Å (b) 2.42 Å
(c) 1.21 Å (d) 3.63 Å *(1998)*

48. In a sinusoidal wave, the time required for a particular point to move from maximum displacement to zero displacement is 0.170 sec. The frequency of wave is

(a) 0.73 Hz (b) 0.36 Hz
(c) 1.47 HZ (d) 2.94 Hz *(1998)*

49. Standing waves are produced in 10 m long stretched string. If the string vibrates in 5 segments and wave velocity is 20 m/s, the frequency is

(a) 5 Hz (b) 10 Hz
(c) 2 Hz (d) 4 Hz. *(1997)*

50. A cylindrical tube, open at both ends has fundamental frequency f in air. The tube is dipped vertically in water, so that half of it is in water. The fundamental frequency of air column is now

(a) $f/2$ (b) $3f/4$
(c) $2f$ (d) f. *(1997)*

51. The equation of a sound wave is $y = 0.0015\sin(62.4x + 316t)$. The wavelength of this wave is

(a) 0.3 unit (b) 0.2 unit
(c) 0.1 unit (d) cannot be calculated. *(1996)*

52. Two sound waves having a phase difference of 60° have path difference of

(a) $\frac{\lambda}{6}$ (b) $\frac{\lambda}{3}$
(c) 2λ (d) $\frac{\lambda}{2}$ *(1996)*

53. The length of a sonometer wire AB is 110 cm. Where should the two bridges be placed from A to divide the wire in 3 segments whose fundamental frequencies are in the ratio of 1 : 2 : 3?

(a) 60 cm and 90 cm
(b) 30 cm and 60 cm
(c) 30 cm and 90 cm
(d) 40 cm and 80 cm. *(1995)*

54. A hospital uses an ultrasonic scanner to locate tumours in a tissue. The operating frequency of the scanner is 4.2 MHz. The speed of sound in a tissue is 1.7 km/s. The wavelength of sound in the tissue is close to
(a) 4×10^{-3} m (b) 8×10^{-3} m
(c) 4×10^{-4} m (d) 8×10^{-4} m. *(1995)*

55. A source of sound gives 5 beats per second, when sounded with another source of frequency 100 second^{-1}. The second harmonic of the source, together with a source of frequency 205 sec^{-1} gives 5 beats per second. What is the frequency of the source?
(a) 105 second^{-1} (b) 205 second^{-1}
(c) 95 second^{-1} (d) 100 second^{-1}. *(1995)*

56. A star, which is emitting radiation at a wavelength of 5000 Å, is approaching the earth with a velocity of 1.5×10^4 m/s. The change in wavelength of the radiation as received on the earth is
(a) 25 Å (b) 100 Å
(c) zero (d) 2.5 Å. *(1995)*

57. Which one of the following represents a wave?
(a) $y = A \sin (\omega t - kx)$
(b) $y = A \cos (at - bx + c)$
(c) $y = A \sin kx$
(d) $y = A \sin \omega t$. *(1994)*

58. A wave of frequency 100 Hz travels along a string towards its fixed end. When this wave travels back, after reflection, a node is formed at a distance of 10 cm from the fixed end. The speed of the wave (incident and reflected) is
(a) 20 m/s (b) 40 m/s
(c) 5 m/s (d) 10 m/s. *(1994)*

59. A stationary wave is represented by $y = A \sin (100t) \cos (0.01x)$, where y and A are in millimetres, t is in seconds and x is in metres. The velocity of the wave is
(a) 10^4 m/s (b) not derivable
(c) 1 m/s (d) 10^2 m/s. *(1994)*

60. A source of frequency υ gives 5 beats/second when sounded with a source of frequency 200 Hz. The second harmonic of frequency 2υ of source gives 10 beats/second when sounded with a source of frequency 420 Hz. The value of υ is
(a) 205 Hz (b) 195 Hz
(c) 200 Hz (d) 210 Hz.

61. Wave has simple harmonic motion whose period is 4 seconds while another wave which also possesses simple harmonic motion has its period 3 sec. If both are combined, then the resultant wave will have the period equal to
(a) 4 sec (b) 5 sec
(c) 12 sec (d) 3 sec

62. A stretched string resonates with tuning fork frequency 512 Hz when length of the string is 0.5 m. The length of the string required to vibrate resonantly with a tuning fork of frequency 256 Hz would be
(a) 0.25 m (b) 0.5 m
(c) 1 m (d) 2 m

63. The temperature at which the speed of sound becomes double as was at 27°C is
(a) 273°C (b) 0°C
(c) 927°C (d) 1027°C

64. For production of beats the two sources must have
(a) different frequencies and same amplitude
(b) different frequencies
(c) different frequencies, same amplitude and same phase
(d) different frequencies and same phase

65. The frequency of sinusodial wave $y = 0.40 \cos [2000\,t + 0.80]$ would be
(a) 1000π Hz (b) 2000 Hz
(c) 20 Hz (d) $\frac{1000}{\pi}$ Hz

66. With the propogation of a longitudinal wave through a material medium, the quantities transmitted in the propogation direction are
(a) energy, momentum and mass
(b) energy
(c) energy and mass
(d) energy and linear momentum

67. Two trains move towards each other with the same speed. The speed of sound is 340 m/s. If the height of the tone of the whistle of each of them heard on the other changes to 9/8 times, then the speed of each train should be
(a) 20 m/s (b) 2 m/s
(c) 200 m/s (d) 2000 m/s *(1991)*

68. A closed organ pipe (closed at one end) is excited to support the third overtone. It is found that air in the pipe has
(a) three nodes and three antinodes
(b) three nodes and four antinodes
(c) four nodes and three antinodes
(d) four nodes and four antinodes *(1991)*

69. Velocity of sound waves in air is 330 m/s. For a particular sound wave in air, a path difference of 40 cm is equivalent to phase difference of $1.6\,\pi$. The frequency of this wave is
(a) 165 Hz (b) 150 Hz
(c) 660 Hz (d) 330 Hz *(1990)*

70. A 5.5 metre length of string has a mass of 0.035 kg. If the tension in the string in 77 N, the speed of a wave on the string is
(a) 110 ms^{-1} (b) 165 ms^{-1}
(c) 77 ms^{-1} (d) 102 ms^{-1} *(1989)*

71. If the amplitude of sound is doubled and the frequency reduced to one fourth, the intensity of sound at the same point will be
(a) increasing by a factor of 2
(b) decreasing by a factor of 2
(c) decreasing by a factor of 4
(d) unchanged *(1989)*

72. The velocity of sound in any gas depends upon
(a) wavelength of sound only
(b) density and elasticity of gas
(c) intensity of sound waves only
(d) amplitude and frequency of sound *(1988)*

73. Equation of progressive wave is given by $y = 4 \sin \left[\pi \left(\frac{t}{5} - \frac{x}{9} \right) + \frac{\pi}{6} \right]$ where y, x are in cm and t is in seconds. Then which of the following is correct ?
(a) $v = 5$ cm (b) $\lambda = 18$ cm
(c) $a = 0.04$ c = m (d) $f = 50$ Hz *(1988)*

EXPLANATIONS

1. **(c) :** Since 4.0 g of a gas occupies 22.4 litres at NTP, so the molecular mass of the gas is

$$M = 4.0 \text{ g mol}^{-1}$$

As the speed of the sound in the gas is

$$v = \sqrt{\frac{\gamma RT}{M}}$$

where γ is the ratio of two specific heats, R is the universal gas constant and T is the temperature of the gas.

$$\therefore \ \gamma = \frac{Mv^2}{RT}$$

Here, $M = 4.0 \text{ g mol}^{-1} = 4.0 \times 10^{-3} \text{ kg mol}^{-1}$,
$v = 952 \text{ ms}^{-1}$, $R = 8.3 \text{ JK}^{-1}\text{ mol}^{-1}$
and $T = 273$ K (at NTP)

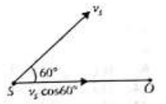
$$\therefore \ \gamma = \frac{(4.0\times10^{-3}\text{ kg mol}^{-1})(952\text{ ms}^{-1})^2}{(8.3\text{ JK}^{-1}\text{mol}^{-1})(273\text{ K})} = 1.6$$

By definition,

$$\gamma = \frac{C_p}{C_v} \text{ or } C_p = \gamma C_v$$

But $\gamma = 1.6$ and $C_v = 5.0 \text{ JK}^{-1}\text{ mol}^{-1}$
$\therefore C_p = (1.6)(5.0 \text{ JK}^{-1}\text{mol}^{-1})$
$= 8.0 \text{ JK}^{-1}\text{mol}^{-1}$

2. **(d) :** Here,
Frequency of source, $\upsilon_0 = 100$ Hz
Velocity of source, $v_s = 19.4 \text{ ms}^{-1}$
Velocity of sound in air, $v = 330 \text{ ms}^{-1}$



As the velocity of source along the source observer line is $v_s\cos60°$ and the observer is at rest, so the apparent frequency observed by the observer is

$$\upsilon = \upsilon_0\left(\frac{v}{v - v_s\cos60°}\right)$$

$$= (100\text{ Hz})\left(\frac{330\text{ ms}^{-1}}{330\text{ ms}^{-1} - (19.4\text{ ms}^{-1})\left(\frac{1}{2}\right)}\right)$$

$$= (100\text{ Hz})\left(\frac{330\text{ ms}^{-1}}{330\text{ ms}^{-1} - 9.7\text{ ms}^{-1}}\right)$$

$$= (100\text{ Hz})\left(\frac{330\text{ ms}^{-1}}{320.3\text{ ms}^{-1}}\right) = 103\text{ Hz}$$

3. **(a) :** For closed organ pipe, fundamental frequency is given by $\upsilon_c = \frac{v}{4l}$

For open organ pipe, fundamental frequency is given by $\upsilon_o = \frac{v}{2l'}$

2nd overtone of open organ pipe

$\upsilon' = 3\upsilon_o$; $\upsilon' = \frac{3v}{2l'}$

According to question, $\upsilon_c = \upsilon'$

$$\frac{v}{4l} = \frac{3v}{2l'}$$

$l' = 6l$
Here, $l = 20$ cm, $l' = ?$
$\therefore l' = 6 \times 20 = 120$ cm

4. **(a) :**

$$n_1 = \frac{1}{2l_1}\sqrt{\frac{T}{\mu}} \quad ...(i)$$

$$n_2 = \frac{1}{2l_2}\sqrt{\frac{T}{\mu}} \quad ...(ii)$$

$$n_3 = \frac{1}{2l_3}\sqrt{\frac{T}{\mu}} \quad ...(iii)$$

$$n = \frac{1}{2l}\sqrt{\frac{T}{\mu}} \quad ...(iv)$$

From eqn. (iv), we get

$$\frac{1}{n} = \frac{2l}{\sqrt{\frac{T}{\mu}}}$$

As $l = l_1 + l_2 + l_3$

$$\therefore \ \frac{1}{n} = \frac{2(l_1+l_2+l_3)}{\sqrt{\frac{T}{\mu}}} = \frac{2l_1}{\sqrt{\frac{T}{\mu}}} + \frac{2l_2}{\sqrt{\frac{T}{\mu}}} + \frac{2l_3}{\sqrt{\frac{T}{\mu}}}$$

$$= \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3} \quad \text{[Using (i), (ii) and (iii)]}$$

5. **(d) :** Fundamental frequency of the closed organ pipe is

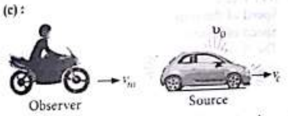
$$\upsilon = \frac{v}{4L}$$

Here, $v = 340 \text{ m s}^{-1}$, $L = 85 \text{ cm} = 0.85$ m

$$\therefore \ \upsilon = \frac{340\text{ m s}^{-1}}{4\times0.85\text{ m}} = 100\text{ Hz}$$

The natural frequencies of the closed organ pipe will be
$\upsilon_n = (2n-1)\upsilon = \upsilon, 3\upsilon, 5\upsilon, 7\upsilon, 9\upsilon, 11\upsilon, 13\upsilon, ...$
$= 100$ Hz, 300 Hz, 500 Hz, 700 Hz, 900 Hz, 1100 Hz, 1300 Hz,... and so on
Thus, the natural frequencies lies below the 1250 Hz is 6.

6. **(c) :**



Here, speed of motorcyclist, $v_m = 36 \text{ km hour}^{-1}$

$$= 36 \times \frac{5}{18} = 10 \text{ m s}^{-1}$$

Speed of car,
$v_c = 18 \text{ km hour}^{-1} = 18 \times \frac{5}{18} \text{ m s}^{-1} = 5 \text{ m s}^{-1}$
Frequency of source, $\upsilon_0 = 1392$ Hz
Speed of sound, $v = 343 \text{ m s}^{-1}$
The frequency of the honk heard by the motorcyclist is

$$\upsilon' = \upsilon_0\left(\frac{v+v_m}{v+v_c}\right) = 1392\left(\frac{343+10}{343+5}\right)$$

$$= \frac{1392\times353}{348} = 1412\text{ Hz}$$

7. **(b) :** Pressure change will be minimum at both ends.

8. **(c) :** The standard equation of a wave travelling along +ve x-direction is given by

$$y = A\sin(kx - \omega t)$$

where
A = Amplitude of the wave
k = angular wave number
ω = angular frequency of the wave

Given: $A = 1$ m, $\lambda = 2\pi$ m, $\upsilon = \frac{1}{\pi}$ Hz

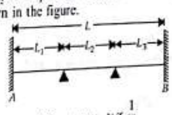
As $k = \frac{2\pi}{\lambda} = \frac{2\pi}{2\pi} = 1$

$$\omega = 2\pi\upsilon = 2\pi \times \frac{1}{\pi} = 2$$

$\therefore$ The equation of the given wave is
$y = 1\sin(1x - 2t) = \sin(x - 2t)$

9. **(c) :** Let υ be frequency of the unknown source. As it gives 4 beats per second when sounded with a source of frequency 250 Hz,
$\therefore \ \upsilon = 250 \pm 4 = 246$ Hz or 254 Hz
Second harmonic of this unknown source = 492 Hz or 508 Hz which gives 5 beats per second, when sounded with a source of frequency 513 Hz.
Therefore unknown frequency, $\upsilon = 254$ Hz.

10. **(d) :** Let L(= 100 cm) be the length of the wire and L_1, L_2 and L_3 are the lengths of the segments as shown in the figure.



Fundamental frequency, $\upsilon \propto \frac{1}{L}$

As the fundamental frequencies are in the ratio of 1 : 3 : 5,

$$\therefore \ L_1 : L_2 : L_3 = \frac{1}{1} : \frac{1}{3} : \frac{1}{5} = 15 : 5 : 3$$

Let x be the common factor. Then

$$15x + 5x + 3x = L = 100$$

$$23x = 100 \text{ or } x = \frac{100}{23}$$

$$\therefore \ L_1 = 15 \times \frac{100}{23} = \frac{1500}{23} \text{ cm}$$

$$L_2 = 5 \times \frac{100}{23} = \frac{500}{23} \text{ cm}$$

$$L_3 = 3 \times \frac{100}{23} = \frac{300}{23} \text{ cm}$$

$\therefore$ The bridges should be placed from A at $\frac{1500}{23}$ cm and $\frac{2000}{23}$ cm respectively.

11. **(a) :** The situation as shown in the figure.

Here,
Speed of listener, $v_L = 1\ \text{ms}^{-1}$
Speed of sound, $v = 330\ \text{ms}^{-1}$
Frequency of each source, $\upsilon = 660$ Hz
Apparent frequency due to P,

$$\upsilon' = \frac{\upsilon(v - v_L)}{v}$$

Apparent frequency due to Q,

$$\upsilon'' = \frac{\upsilon(v + v_L)}{v}$$

Number of beats heard by the listener per second is

$$\upsilon'' - \upsilon' = \frac{\upsilon(v + v_L)}{v} - \upsilon\frac{(v - v_L)}{v}$$
$$= \frac{2\upsilon v_L}{v} = \frac{2 \times 660 \times 1}{330} = 4$$

12. **(c) :** Let l be the length of the string.
Fundamental frequency is given by

$$\upsilon = \frac{1}{2l}\sqrt{\frac{T}{\mu}}$$

or $\upsilon \propto \frac{1}{l}$ ($\because$ T and μ are constants)

Here, $l_1 = \frac{k}{\upsilon_1}, l_2 = \frac{k}{\upsilon_2}, l_3 = \frac{k}{\upsilon_3}$ and $l = \frac{k}{\upsilon}$

But $l = l_1 + l_2 + l_3$

$$\therefore \quad \frac{1}{\upsilon} = \frac{1}{\upsilon_1} + \frac{1}{\upsilon_2} + \frac{1}{\upsilon_3}$$

13. **(d) :** Given : $y_1 = 4\sin 600\pi t$, $y_2 = 5\sin 608\pi t$
$\therefore$ $\omega_1 = 600\pi$ or $2\pi\upsilon_1 = 600\pi$ or $\upsilon_1 = 300$
$A_1 = 4$
and $\omega_2 = 608\pi$ or $2\pi\upsilon_2 = 608\pi$ or $\upsilon_2 = 304$
$A_2 = 5$
Number of beats heard per second
$= \upsilon_2 - \upsilon_1 = 304 - 300 = 4$

$$\frac{I_{max}}{I_{min}} = \frac{(A_1 + A_2)^2}{(A_1 - A_2)^2} = \frac{(4+5)^2}{(4-5)^2} = \frac{81}{1}$$

14. **(b) :** The given wave equation is

$$y = 3\sin\frac{\pi}{2}(50t - x)$$
$$y = 3\sin\left(25\pi t - \frac{\pi}{2}x\right) \quad \text{...(i)}$$

The standard wave equation is
$y = A\sin(\omega t - kx)$ ...(ii)
Comparing (i) and (ii), we get

$$\omega = 25\pi, \ k = \frac{\pi}{2}$$

Wave velocity,

$$v = \frac{\omega}{k} = \frac{25\pi}{(\pi/2)} = 50\ \text{ms}^{-1}$$

Particle velocity, $v_p = \frac{dy}{dt} = \frac{d}{dt}\left(3\sin\left(25\pi t - \frac{\pi}{2}\right)\right)$

$$= 75\pi\cos\left(25\pi t - \frac{\pi}{2}\right)$$

Maximum particle velocity, $(v_p)_{max} = 75\pi\ \text{ms}^{-1}$

$$\therefore \quad \frac{(v_p)_{max}}{v} = \frac{75\pi}{50} = \frac{3}{2}\pi$$

15. **(c) :** Here,
Speed of the train, $v_T = 220\ \text{ms}^{-1}$
Speed of sound in air, $v = 330\ \text{ms}^{-1}$
The frequency of the echo detected by the driver of the train is

$$\upsilon' = \upsilon\left(\frac{v + v_T}{v - v_T}\right) = 1000\left(\frac{330 + 220}{330 - 220}\right)$$
$$= 1000 \times \frac{550}{110} = 5000\ \text{Hz}$$

16. **(a) :** $y_1 = a\sin(\omega t + kx + 0.57)$
$\therefore$ Phase, $\phi_1 = \omega t + kx + 0.57$

$$y_2 = a\cos(\omega t + kx) = a\sin\left(\omega t + kx + \frac{\pi}{2}\right)$$

$\therefore$ Phase, $\phi_2 = \omega t + kx + \frac{\pi}{2}$

Phase difference, $\Delta\phi = \phi_2 - \phi_1$

$$= \left(\omega t + kx + \frac{\pi}{2}\right) - (\omega t + kx + 0.57) = \frac{\pi}{2} - 0.57$$
$$= (1.57 - 0.57)\ \text{radian} = 1\ \text{radian}$$

17. **(c) :** Here, $v_{air} = 350$ m/s, $v_{brass} = 3500$ m/s
When a sound wave travels from one medium to another medium its frequency remains the same

$\because$ Frequency, $\upsilon = \frac{v}{\lambda}$

Since υ remains the same in both the medium

$$\Rightarrow \quad \frac{v_{air}}{\lambda_{air}} = \frac{v_{brass}}{\lambda_{brass}}$$
$$\lambda_{brass} = \lambda_{air} \times \frac{v_{brass}}{v_{air}} = \lambda_{air} \times \frac{3500}{350} = 10\lambda_{air}$$

18. **(b) :** As $\upsilon = \frac{1}{2L}\sqrt{\frac{T}{\mu}}$, $\therefore$ $\frac{\Delta\upsilon}{\upsilon} = \frac{1}{2}\frac{\Delta T}{T}$

$$\frac{\Delta T}{T} = 2\frac{\Delta\upsilon}{\upsilon} = 2 \times \frac{6}{600} = 0.02$$

19. **(c) :** The given wave equation is
$y = A\sin(\omega t - kx)$

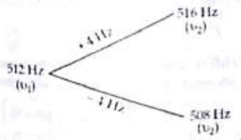
Wave velocity, $v = \frac{\omega}{k}$ ...(i)

Particle velocity, $v_p = \frac{dy}{dt} = A\omega\cos(\omega t - kx)$

Maximum particle velocity, $(v_p)_{max} = A\omega$ ...(ii)
According to the given question

$$v = (v_p)_{max}$$
$$\frac{\omega}{k} = A\omega \quad \text{(Using (i) and (ii))}$$
$$\frac{1}{k} = A$$
$$\text{or} \quad \frac{\lambda}{2\pi} = A \quad \left(\because \ k = \frac{2\pi}{\lambda}\right)$$
$$\lambda = 2\pi A$$

20. **(d) :** Let the frequencies of tuning fork and piano string be υ_1 and υ_2 respectively.
$\therefore$ $\upsilon_2 = \upsilon_1 \pm 4 = 512\ \text{Hz} \pm 4$
$= 516$ Hz or 508 Hz



Increase in the tension of a piano string increases its frequency.
If $\upsilon_2 = 516$ Hz, further increase in υ_2, resulted in an increase in the beat frequency. But this is not given in the question.
If $\upsilon_2 = 508$ Hz, further increase in υ_2 resulted in decrease in the beat frequency. This is given in the question. When the beat frequency decreases to 2 beats per second. Therefore, the frequency of the piano string before increasing the tension was 508 Hz.

21. **(a) :** $l_1 = 0.516$ m, $l_2 = 0.491$ m, $T = 20$ N.
Mass per unit length, $\mu = 0.001$ kg/m.

Frequency, $\upsilon = \frac{1}{2l}\sqrt{\frac{T}{\mu}}$

$$\upsilon_1 = \frac{1}{2 \times 0.516}\sqrt{\frac{20}{0.001}}$$
$$\upsilon_2 = \frac{1}{2 \times 0.491}\sqrt{\frac{20}{0.001}}$$

$\therefore$ Number of beats $= \upsilon_1 - \upsilon_2 = 7$.

22. **(b) :** Car is the source and the hill is observer.
Frequency heard at the hill, υ_1

$$\therefore \ \upsilon_1 = \frac{\upsilon \times v}{(v - V)} = \frac{600 \times 330}{330 - 30}$$

Now for reflection, the hill is the source and the driver the observer.

$$\therefore \ \upsilon_2 = \upsilon_1 \times \frac{(330 + 30)}{330}$$
$$\Rightarrow \ \upsilon_2 = \frac{600 \times 330}{300} \times \frac{360}{330} \Rightarrow \upsilon_2 = 720\ \text{Hz}.$$

23. **(c) :** Amplitude $= 2$ cm $= 0.02$ m, $v = 128$ m/s

$$\lambda = \frac{4}{5} = 0.8\ \text{m}; \ \upsilon = \frac{128}{0.8} = 160\ \text{Hz}$$
$$\omega = 2\pi\upsilon = 2\pi \times 160 = 1005; \quad k = \frac{2\pi}{\lambda} = \frac{2\pi}{0.8} = 7.85$$
$$\therefore \quad y = 0.02\sin(7.85x - 1005t)$$

24. **(b) :** $x = a\sin(\omega t + \pi/6)$

$$\frac{dx}{dt} = a\omega\cos(\omega t + \pi/6)$$

Max. velocity $= a\omega$

$$\therefore \quad \frac{a\omega}{2} = a\omega\cos(\omega t + \pi/6);$$
$$\therefore \quad \cos(\omega t + \pi/6) = \frac{1}{2}$$
$$60^\circ \text{ or } \frac{2\pi}{6}\ \text{radian} = \frac{2\pi}{T}\cdot t + \pi/6;$$
$$\frac{2\pi}{T}\cdot t = \frac{2\pi}{6} - \frac{\pi}{6} = +\frac{\pi}{6}$$
$$\therefore \quad t = +\frac{\pi}{6} \times \frac{T}{2\pi} = \left|+\frac{T}{12}\right|$$

25. **(b) :** Other factors such as ω and v remaining the same, $I = A^2 \times$ constant K, or $A = \sqrt{\frac{I}{K}}$

On superposition

$A_{max} = A_1 + A_2$ and $A_{min} = A_1 - A_2$

$\therefore \quad A^2_{max} = A_1^2 + A_2^2 + 2A_1A_2$

$$\Rightarrow \frac{I_{max}}{K} = \frac{I_1}{K} + \frac{I_2}{K} + \frac{2\sqrt{I_1 I_2}}{K}$$

$$A^2_{min} = A_1^2 + A_2^2 - 2A_1A_2$$

$$\Rightarrow \frac{I_{min}}{K} = \frac{I_1}{K} + \frac{I_2}{K} - \frac{2\sqrt{I_1 I_2}}{K}$$

$\therefore \quad I_{max} + I_{min} = 2I_1 + 2I_2$

26. **(a)** : $y = 0.25\sin(10\pi x - 2\pi t)$

$y_{max} = 0.25$

$k = \frac{2\pi}{\lambda} = 10\pi \Rightarrow \lambda = 0.2$ m

$\omega = 2\pi f = 2\pi \Rightarrow f = 1$ Hz

The sign is negative inside the bracket. Therefore this wave travels in the positive x-direction.

27. **(b)** : $Y_1 = 4\sin 500\pi t$, $Y_2 = 2\sin 506\pi t$

$\omega_1 = 500\pi$, $\omega_1 = 2\pi\upsilon$, $\upsilon_1 = 250$, $\upsilon_2 = 253$

$\upsilon = \upsilon_2 - \upsilon_1 = 253 - 250 = 3$ beats/s.

Number of beats per minute $= 3 \times 60 = 180$.

28. **(a)** : Frequency $= \frac{\text{velocity}}{\text{wavelength}}$

$\therefore \quad \upsilon_1 = \frac{v}{\lambda_1} = \frac{330}{5} = 66$ Hz

and $\upsilon_2 = \frac{v}{\lambda_2} = \frac{330}{5.5} = 60$ Hz

Number of beats per second $= \upsilon_1 - \upsilon_2$
$= 66 - 60 = 6$.

29. **(b)** : Reverberation time, $T = \frac{0.61V}{aS}$

where V is the volume of room in cubic metres, a is the average absorption coefficient of the room, S is the total surface area of room in square metres.

or, $\quad T \propto \frac{V}{S}$

or, $\quad \frac{T_1}{T_2} = \left(\frac{V_1}{V_2}\right)\left(\frac{S_2}{S_1}\right) = \left(\frac{V}{8V}\right)\left(\frac{4S}{S}\right) = \frac{1}{2}$

or, $\quad T_2 = 2T_1 = 2 \times 1 = 2$ sec. $(\because T_1 = 1$ sec$)$

30. **(a)** : $y(x, t) = 8.0\sin(0.5\pi x - 4\pi t - \frac{\pi}{4})$

Compare with a standard wave equation,

$$y = a\sin\left(\frac{2\pi x}{\lambda} - \frac{2\pi t}{T} + \phi\right)$$

we get $\frac{2\pi}{\lambda} = 0.5\pi$ or, $\lambda = \frac{2\pi}{0.5\pi} = 4$ m

$\frac{2\pi}{T} = 4\pi$ or, $T = \frac{2\pi}{4\pi} = \frac{1}{2}$ sec.

$\upsilon = 1/T = 2$ Hz.

Wave velocity, $v = \lambda\upsilon = 4 \times 2 = 8$ m/sec.

31. **(c)** : Light waves are electromagnetic waves. Light waves are transverse in nature and do not require a medium to travel, hence they can travel in vacuum. Sound waves are longitudinal waves and require a medium to travel. They do not travel in vacuum.

32. **(c)** : $d_1 = 2$ m, $d_2 = 3$ m

Intensity $\propto \frac{1}{(\text{distance})^2}$

$I_1 \propto \frac{1}{2^2}$ and $I_2 \propto \frac{1}{3^2}$

$\therefore \quad \frac{I_1}{I_2} = \frac{9}{4}$.

33. **(a)** : $y_1 = 10^{-6}\sin[100t + (x/50) + 0.5]$

$y_2 = 10^{-6}\cos[100t + (x/50)]$
$= 10^{-6}\sin[100t + (x/50) + \pi/2]$
$= 10^{-6}\sin[100t + (x/50) + 1.57]$

[using $\cos x = \sin(x + \pi/2)$]

The phase difference $= 1.57 - 0.5 = 1.07$

[or using $\sin x = \cos(\pi/2 - x)$. We get the same result.]

34. **(b)** : 1st the car is the source and at the cliff, one observes f'.

$\therefore \quad f' = \frac{v}{v - v_s}f$

2[nd] cliff is now source. It emits frequency f' and the observer is now the driver who observes f''.

$\therefore \quad f'' = \left[\frac{v + v_o}{v}\right]f'$ or $2f = \left[\frac{v + v_o}{v - v_s}\right]f$

$\Rightarrow 2v - 2v_o = v + v_o \Rightarrow v = v_o + 2v_o$ [as $v_s = v_o$]

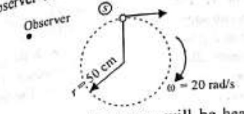
$\Rightarrow v_o = \frac{v}{3}$

35. **(b)** : Apparent frequency $f' = \frac{v + v_o}{v}f$

$= \frac{v + (1/5)v}{v}f = 1.2f$

Wavelength does not change by motion of observer.

36. **(b)** : The whistle is revolving in a circle of radius 50 cm. So the source (whistle) is moving and the observer is fixed.



The minimum frequency will be heard by the observer when the linear velocity of the whistle (source) will be in a direction as shown in the figure, *i.e.* when the source is receding.

The apparent frequency heard by the observer is then given by $\upsilon' = \upsilon\frac{V}{V + v}$

where V and v are the velocities of sound and source respectively and υ is the actual frequency.

Now, $v = r\omega = 0.5 \times 20 = 10$ m/s

$V = 340$ m/s, $\upsilon = 385$ Hz.

$\therefore \quad \upsilon' = 385 \times \frac{340}{340 + 10} = 374$ Hz.

37. **(c)** : The equation of progressive wave travelling in positive x-direction is given by

$y = a\sin\frac{2\pi}{\lambda}(vt - x)$.

Here $a = 0.2$ m, $v = 360$ m/sec, $\lambda = 60$ m

$\therefore \quad y = 0.2\sin\frac{2\pi}{60}(360t - x) = 0.2\sin\left[2\pi\left(6t - \frac{x}{60}\right)\right]$.

38. **(c)** : Comparing the given equation with general equation, $y = a\sin 2\pi\left(\frac{t}{T} - \frac{x}{\lambda}\right)$, we get

$T = \frac{2\pi}{100}$ and $\lambda = 20\pi$

$\therefore \quad v = \upsilon\lambda = \frac{100}{2\pi} \times 20\pi = 1000$ m/s.

39. **(b)** : Resultant amplitude $= 2a(1 + \cos\phi) = a$

$\therefore (1 + \cos\phi) = 1/2; \quad \cos\phi = -\frac{1}{2}; \quad \phi = \frac{2\pi}{3}$.

40. **(c)** : $n = \frac{1}{2l}\sqrt{\frac{T}{\pi r^2\rho}}$

$\rho_1' = \frac{\rho}{2}$; $T' = 2T$ and $D' = 2D$ or $r' = 2r$

$$n' = \frac{1}{2l}\sqrt{\frac{2T}{\pi(2r)^2\frac{\rho}{2}}}$$

after solving, $n' = \frac{1}{2l}\sqrt{\frac{T}{\pi r^2 l}} = n$.

41. **(b)** : Given : $x = a\cos(\omega t + \delta)$

and $y = a\cos(\omega t + \alpha)$ ...(i)

where, $\delta = \alpha + \pi/2$

$\therefore \quad x = a\cos(\omega t + \alpha + \pi/2)$
$= -a\sin(\omega t + \alpha)$ ...(ii)

Given the two waves are acting in perpendicular direction with the same frequency and phase difference $\pi/2$

From equations (i) and (ii),

$x^2 + y^2 = a^2$

which represents the equation of a circle.

42. **(a)** : As $n \propto (1/l)$ and $l = l_1 + l_2 + l_3$

$\therefore \quad \frac{1}{n} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3}$.

43. **(a)** : $f' = \frac{v - u}{v}f$; $f'' = \frac{v + u}{v}f$

No. of beats $= f'' - f' = \frac{2u}{\lambda}$

44. **(c)** : Number of beats produced per sec.

$= \upsilon_1 - \upsilon_2 = \frac{v}{\lambda_1} - \frac{v}{\lambda_2}$

$12 = v\left[\frac{1}{50} - \frac{1}{51}\right]$ or, $12 = \frac{v \times 1}{50 \times 51}$

or, $\quad v = 12 \times 50 \times 51$ cm/s $= 306$ m/s.

45. **(d)** : The given equation of wave is

$y = y_0\sin\frac{2\pi}{\lambda}(vt - x)$

Particle velocity $= \frac{dy}{dt} = y_0\cos\frac{2\pi}{\lambda}(vt - x)\cdot\frac{2\pi v}{\lambda}$

$\left(\frac{dy}{dt}\right)_{max} = y_0 \cdot \frac{2\pi}{\lambda}v$.

$\therefore \quad y_0 \cdot \frac{2\pi}{\lambda}v = 2v$ or, $\lambda = \pi y_0$.

46. **(b)** : $n' = n + n_1 = \frac{nv}{v - v_s\cos\theta} = \frac{nv}{v}$ $[\because \cos 90° = 0]$

$n' = n \quad \therefore n_1 = 0$

47. **(c)** : Distance between a node and adjoining antinode

$= \lambda/4$

From figure, distance between two atoms

$= 4 \times \frac{\lambda}{4} = 1.21$ Å or, $\lambda = 1.21$ Å.

48. **(c) :** Displacement, $Y_{max} = a$, $Y_{min} = 0$
Time taken = $T/4$
$\therefore T/4 = 0.170 \quad \therefore T = 0.68$
The frequency of wave = $1/T$ = 1.47 Hz

49. **(a) :** The frequency of standing wave

$$\upsilon = \frac{P}{2l}\sqrt{\frac{T}{m}}$$

or, $$\upsilon = \frac{P}{2l}v = \frac{5\times 20}{2\times 10} = 5\text{ Hz}.$$

50. **(d) :** For the cylindrical tube open at both ends, $f = v/2l$.
When half of the tube is in water, it behaves as a closed pipe of length $l/2$.

$$\therefore \quad f' = \frac{v}{4(l/2)} = \frac{v}{2l}. \quad \therefore f' = f.$$

51. **(c) :** Sound wave equation is
$y = 0.0015 \sin(62.4x + 316t)$.
Comparing it with the general equation of motion

$$y = A\sin 2\pi\left[\frac{x}{\lambda}+\frac{t}{T}\right], \text{ we get } \frac{2\pi}{\lambda} = 62.4$$

or $$\lambda = \frac{2\pi}{62.4} = 0.1 \text{ unit.}$$

52. **(a) :** Phase difference $\theta = 60° = \frac{\pi}{3}$ rad.

Phase difference $(\theta) = \frac{\pi}{3} = \frac{2\pi}{\lambda} \times$ Path difference.

Therefore path difference = $\frac{\pi}{3} \times \frac{\lambda}{2\pi} = \frac{\lambda}{6}$.

53. **(a) :** Length of sonometer wire (l) = 110 cm and ratio of frequencies = 1 : 2 : 3.

Frequency $(\upsilon) \propto \frac{1}{l}$ or $l \propto \frac{1}{\upsilon}$.

Therefore $AC : CD : DB = \frac{1}{1} : \frac{1}{2} : \frac{1}{3} = 6 : 3 : 2$.

Therefore $AC = 6 \times \frac{110}{11} = 60$ cm and

$CD = 3 \times \frac{110}{11} = 30$ cm.

Thus $AD = 60 + 30 = 90$ cm.

54. **(c) :** Frequency (υ) = 4.2 MHz = 4.2×10^6 Hz and speed of sound (v) = 1.7 km/s = 1.7×10^3 m/s.

Wave length of sound in tissue $(\lambda) = \frac{v}{\upsilon} = \frac{1.7\times10^3}{4.2\times10^6}$
$= 4 \times 10^{-4}$ m.

55. **(a) :** Frequency of first source with 5 beats/sec = 10 and frequency of second source with 5 beats/sec = 205. The frequency of the first source = 100 ± 5, 105 or 95 Hz. Therefore frequency of second harmonic source = 210 Hz or 190 Hz. As the second harmonic gives 5 beats/second with the sound of frequency 205 Hz, therefore frequency of second harmonic source should be 210 Hz. The frequency of source = 105 Hz.

56. **(a) :** Wavelength (λ) = 5000 Å and velocity $(v) = 1.5 \times 10^4$ m/s. Wavelength of the approaching star, $(\lambda') = \lambda\frac{c - v_s}{c}$ or $\frac{\lambda'}{\lambda} = 1 - \frac{v}{c}$

or, $$\frac{v}{c} = 1 - \frac{\lambda'}{\lambda} = \frac{\lambda - \lambda'}{\lambda} = \frac{\Delta\lambda}{\lambda}$$

Therefore $\Delta\lambda = \lambda \times \frac{v}{c} = 5000\text{ Å} \times \frac{1.5\times10^4}{3\times10^8} = 25$ Å
(where $\Delta\lambda$ is the change in the wavelength)

57. **(a, b) :** (a) represents a harmonic progressive wave in the standard form where as (b) also represents a harmonic progressive wave, both travelling in the positive x- direction. In (b), a is the angular velocity, ω and b is k; c is the initial phase.
(d) represents only S.H.M.

58. **(a) :** Frequency (υ) = 100 Hz and distance from fixed end = 10 cm = 0.1 m. When a stationary wave is produced, the fixed end behaves as a node. The wavelength $(\lambda) = 2 \times 0.1 = 0.2$ m.
Therefore velocity $v = \upsilon\lambda = 100 \times 0.2 = 20$ m/s

59. **(a) :** $y = A\sin(100t)\cos(0.01x)$. Comparing it with standard equation

$$y = A\sin\left(\frac{2\pi}{T}t\right)\cos\left(\frac{2\pi}{\lambda}x\right),$$

we get $T = \frac{\pi}{50}$ and $\lambda = 200\pi$.

Therefore velocity, $(v) = \frac{\lambda}{T} = \frac{200\pi}{\pi/50} = 200 \times 50$
$= 10000 = 10^4$ m/s.

60. **(a) :** First case: Frequency = υ;
No. of beats/sec. = 5 and
frequency (sounded with) = 200 Hz.
Second case: Frequency = 2 υ; No. of beats/sec = 10 and frequency (sounded with) = 420 Hz.
In the first case, frequency $(\upsilon) = 200 \pm 5 = 205$ or 195 Hz. And in the second case, frequency $(2\upsilon) = 420 \pm 10$

or $\upsilon = 210 \pm 5 = 205$ or 215. So common value of υ in both the cases is 205 Hz.

61. **(c) :** Beats are produced. Frequency of beats will be $\frac{1}{3} - \frac{1}{4} = \frac{1}{12}$. Hence time period = 12 s.

62. **(c) :** $f = \frac{1}{2l}\left[\frac{T}{\mu}\right]^{\frac{1}{2}}$ when f is halved, the length is doubled
$\therefore$ Length is 1 m.

63. **(c) :** velocity of sound $v \propto \sqrt{T}$

$$\therefore \quad \frac{v}{2v} = \frac{\sqrt{273+27}}{\sqrt{T}} \text{ or } T = 1200\text{ K} = 927°\text{C}$$

64. **(b) :** For production of beats different frequencies are essential. The different amplitudes effect the minimum and maximum amplitude of the beats. If frequencies are different, phases will be different.

65. **(d) :** Compare with the equation
$y = a\cos(2\pi\upsilon t + \phi)$
This give $2\pi\upsilon = 2000$

$$\upsilon = \frac{1000}{\pi}\text{ Hz}$$

66. **(b) :** With the propogation of a longitudinal wave, energy alone is propagated.

67. **(a) :** Here $\upsilon' = \frac{9}{8}\upsilon$
Source and observer are moving in opposite direction, apparent frequency

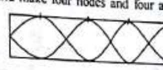
$$\upsilon' = \upsilon \times \frac{(v+u)}{(v-u)}$$

$$\frac{9}{8}\upsilon = \upsilon \times \frac{340+u}{340-u}$$

$\Rightarrow \quad 9 \times 340 - 9u = 8 \times 340 + 8u$

$\Rightarrow \quad 17u = 340 \times 1 \Rightarrow u = \frac{340}{17} = 20$ m/s

68. **(d) :** Third overtone has a frequency $4n$, 4th harmonic = three full loops + one half loop, which would make four nodes and four antinodes.



69. **(c) :** From $\Delta x = \frac{\lambda}{2\pi}\Delta\phi$,

$$\lambda = 2\pi\frac{\Delta x}{\Delta\phi} = \frac{2\pi(0.4)}{1.6\pi} = 0.5\text{ m}$$

$$\upsilon = \frac{v}{\lambda} = \frac{330}{0.5} = 660\text{ Hz}$$

70. **(a) :** $\mu = \frac{0.035}{5.5}$ kg/m, $T = 77$ N
where μ is mass per unit length.

$$v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{77\times5.5}{0.035}} = 110\text{ m/s}$$

71. **(c) :** Intensity $\propto$ (amplitude)^2 and also intensity $\propto$ (frequency)^2. Therefore
original $I \propto A^2\omega^2$

$$I' \propto 4A^2\frac{\omega^2}{16} \quad i.e., \frac{1}{4}I$$

72. **(b) :** Velocity of sound in any gas depends upon density and elasticity of gas.

$$v = \sqrt{\frac{\gamma P}{\rho}} \text{ or } \sqrt{\frac{B}{\rho}}$$

73. **(b) :** The standard equation of a progressive wave is

$$y = a\sin\left[2\pi\left(\frac{t}{T} - \frac{x}{\lambda}\right) + \phi\right]$$

The given equation can be written as

$$y = 4\sin\left[2\pi\left(\frac{t}{10} - \frac{x}{18}\right) + \frac{\pi}{6}\right]$$

$\therefore \quad a = 4$ cm, $T = 10$ s,
$\lambda = 18$ cm and $\phi = \pi/6$.

CHAPTER

12 Electrostatics

1. A parallel plate air capacitor has capacity C, distance of separation between plates is d and potential difference V is applied between the plates. Force of attraction between the plates of the parallel plate air capacitor is

(a) $\frac{CV^2}{d}$ (b) $\frac{C^2V^2}{2d^2}$

(c) $\frac{C^2V^2}{2d}$ (d) $\frac{CV^2}{2d}$

(AIPMT 2015)

2. If potential (in volts) in a region is expressed as $V(x, y, z) = 6xy - y + 2yz$, the electric field (in N/C) at point (1, 1, 0) is

(a) $-(2\hat{i}+3\hat{j}+\hat{k})$ (b) $-(6\hat{i}+9\hat{j}+\hat{k})$

(c) $-(3\hat{i}+5\hat{j}+3\hat{k})$ (d) $-(6\hat{i}+5\hat{j}+2\hat{k})$

(AIPMT 2015)

3. The electric field in a certain region is acting radially outward and is given by $E = Ar$. A charge contained in a sphere of radius 'a' centred at the origin of the field, will be given by

(a) $4\pi\varepsilon_0 Aa^3$ (b) $\varepsilon_0 Aa^3$

(c) $4\pi\varepsilon_0 Aa^2$ (d) $A\varepsilon_0 a^2$

(AIPMT 2015, Cancelled)

4. A parallel plate air capacitor of capacitance C is connected to a cell of emf V and then disconnected from it. A dielectric slab of dielectric constant K, which can just fill the air gap of the capacitor, is now inserted in it. Which of the following is incorrect?

(a) The change in energy stored is $\frac{1}{2}CV^2\left(\frac{1}{K}-1\right)$.

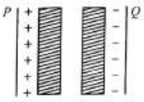
(b) The charge on the capacitor is not conserved.

(c) The potential difference between the plates decreases K times.

(d) The energy stored in the capacitor decreases K times.

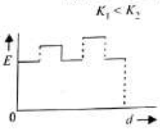
(AIPMT 2015, Cancelled)

5. Two thin dielectric slabs of dielectric constants K_1 and K_2 ($K_1 < K_2$) are inserted between plates of a parallel plate capacitor, as shown in the figure. The variation of electric field E between the plates with distance d as measured from plate P is correctly shown by

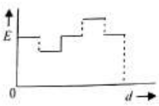


$K_1 < K_2$

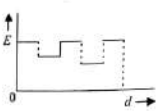
(a)



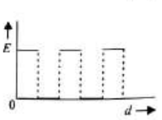
(b)



(c)



(d)



(AIPMT 2014)

6. A conducting sphere of radius R is given a charge Q. The electric potential and the electric field at the centre of the sphere respectively are

(a) zero and $\frac{Q}{4\pi\varepsilon_0 R^2}$

(b) $\frac{Q}{4\pi\varepsilon_0 R}$ and zero

(c) $\frac{Q}{4\pi\varepsilon_0 R}$ and $\frac{Q}{4\pi\varepsilon_0 R^2}$

(d) both are zero

(AIPMT 2014)

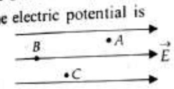
7. In a region, the potential is represented by $V(x, y, z) = 6x - 8xy - 8y + 6yz$, where V is in volts and x, y, z are in metres. The electric force experienced by a charge of 2 coulomb situated at point (1, 1, 1) is

(a) $6\sqrt{5}$ N (b) 30 N

(c) 24 N (d) $4\sqrt{35}$ N

(AIPMT 2014)

8. A, B and C are three points in a uniform electric field. The electric potential is



(a) maximum at C

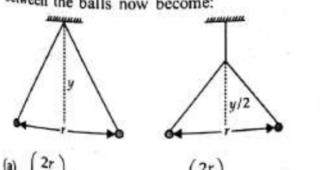
(b) same at all the three points A, B and C

(c) maximum at A

(d) maximum at B

(NEET 2013)

9. Two pith balls carrying equal charges are suspended from a common point by strings of equal length, the equilibrium separation between them is r. Now the strings are rigidly clamped at half the height. The equilibrium separation between the balls now become:



(a) $\left(\frac{2r}{\sqrt{3}}\right)$ (b) $\left(\frac{2r}{3}\right)$

(c) $\left(\frac{1}{\sqrt{2}}\right)^2$ (d) $\left(\frac{r}{\sqrt[3]{2}}\right)$

(NEET 2013)

10. An electric dipole of dipole moment p is aligned parallel to a uniform electric field E. The energy required to rotate the dipole by 90° is

(a) p^2E (b) pE

(c) infinity (d) pE^2

(Karnataka NEET 2013)

11. A charge 'q' is placed at the centre of the line joining two equal charges 'Q'. The system of the three charges will be in equilibrium if 'q' is equal to

(a) $-Q/4$ (b) $Q/4$

(c) $-Q/2$ (d) $Q/2$

(Karnataka NEET 2013)

12. An electric dipole of moment p is placed in an electric field of intensity E. The dipole acquires a position such that the axis of the dipole makes an angle θ with the direction of the field. Assuming that the potential energy of the dipole to be zero when $\theta = 90°$, the torque and the potential energy of the dipole will respectively be

(a) $pE\sin\theta$, $-pE\cos\theta$

(b) $pE\sin\theta$, $-2pE\cos\theta$

(c) $pE\sin\theta$, $2pE\cos\theta$

(d) $pE\cos\theta$, $-pE\sin\theta$

(Prelims 2012)

13. Four point charges $-Q$, $-q$, $2q$ and $2Q$ are placed, one at each corner of the square. The relation between Q and q for which the potential at the centre of the square is zero is

(a) $Q = -q$ (b) $Q = -\frac{1}{q}$

(c) $Q = q$ (d) $Q = \frac{1}{q}$

(Prelims 2012)

14. What is the flux through a cube of side a if a point charge of q is at one of its corner?

(a) $\frac{2q}{\varepsilon_0}$ (b) $\frac{q}{8\varepsilon_0}$

(c) $\frac{q}{\varepsilon_0}$ (d) $\frac{q}{2\varepsilon_0}6a^2$

(Prelims 2012)

15. A parallel plate capacitor has a uniform electric field E in the space between the plates. If the distance between the plates is d and area of each plate is A, the energy stored in the capacitor is

(a) $\frac{1}{2}\varepsilon_0 E^2$ (b) $\frac{E^2Ad}{\varepsilon_0}$

(c) $\frac{1}{2}\varepsilon_0 E^2 Ad$ (d) $\varepsilon_0 EAd$

(Mains 2012, Prelims 2011, Prelims 2008)

16. Two metallic spheres of radii 1 cm and 3 cm are are given charges of -1×10^{-2} C and 5×10^{-2} C, respectively. If these are connected by a conducting wire, the final charge on the bigger sphere is

(a) 2×10^{-2} C (b) 3×10^{-2} C

(c) 4×10^{-2} C (d) 1×10^{-2} C

(Mains 2012)

17. A charge Q is enclosed by a Gaussian spherical surface of radius R. If the radius is doubled, then the outward electric flux will

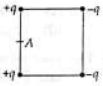
(a) increase four times

(b) be reduced to half

(c) remain the same (d) be doubled

(Prelims 2011)

18. Four electric charges $+q, +q, -q$ and $-q$ are placed at the corners of a square of side $2L$ (see figure). The electric potential at point A, midway between the two charges $+q$ and $+q$, is



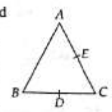
(a) $\frac{1}{4\pi\varepsilon_0}\frac{2q}{L}(1+\sqrt{5})$

(b) $\frac{1}{4\pi\varepsilon_0}\frac{2q}{L}\left(1+\frac{1}{\sqrt{5}}\right)$

(c) $\frac{1}{4\pi\varepsilon_0}\frac{2q}{L}\left(1-\frac{1}{\sqrt{5}}\right)$

(d) zero *(Prelims 2011)*

19. Three charges, each $+q$, are placed at the corners of an isosceles triangle ABC of sides BC and AC, $2a$. D and E are the mid points of BC and CA. The work done in taking a charge Q from D to E is



(a) $\frac{3qQ}{4\pi\varepsilon_0 a}$ (b) $\frac{3qQ}{8\pi\varepsilon_0 a}$

(c) $\frac{qQ}{4\pi\varepsilon_0 a}$ (d) zero *(Mains 2011)*

20. The electric potential V at any point (x, y, z), all in metres in space is given by $V = 4x^2$ volt. The electric field at the point (1, 0, 2) in volt/meter, is

(a) 8 along negative X-axis

(b) 8 along positive X-axis

(c) 16 along negative X-axis

(d) 16 along positive X-axis *(Mains 2011)*

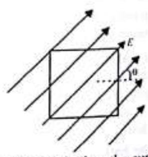
21. Two positive ions, each carrying a charge q, are separated by a distance d. If F is the force of repulsion between the ions, the number of electrons missing from each ion will be (e being the charge on an electron)

(a) $\frac{4\pi\varepsilon_0 Fd^2}{e^2}$ (b) $\sqrt{\frac{4\pi\varepsilon_0 Fe^2}{d^2}}$

(c) $\sqrt{\frac{4\pi\varepsilon_0 Fd^2}{e^2}}$ (d) $\frac{4\pi\varepsilon_0 Fd^2}{q^2}$

(Prelims 2010)

22. A square surface of side L meter in the plane of the paper is placed in a uniform electric field E(volt/m) acting along the same plane at an angle q with thehorizontal side of the square as shown in figure.



The electric flux linked to the surface, in units of volt m is

(a) EL^2 (b) $EL^2\cos\theta$

(c) $EL^2\sin\theta$ (d) zero *(Prelims 2010)*

23. A series combination of n_1 capacitors, each of value C_1, is charged by a source of potential difference $4V$. When another parallel combination of n_2 capacitors, each of value C_2, is charged by a source of potential difference V, it has the same (total) energy stored in it, as the first combination has. The value of C_2, in terms of C_1, is then

(a) $\frac{2C_1}{n_1 n_2}$ (b) $16\frac{n_2}{n_1}C_1$

(c) $2\frac{n_2}{n_1}C_1$ (d) $\frac{16C_1}{n_1 n_2}$

(Prelims 2010)

24. Two parallel metal plates having charges $+Q$ and $-Q$ face each other at a certain distance between them. If the plates are now dipped in kerosene oil tank, the electric field between the plates will

(a) become zero (b) increase

(c) decrease (d) remain same

(Mains 2010)

25. The electric field at a distance $\frac{3R}{2}$ from the centre of a charged conducting spherical shell of radius R is E. The electric field at a distance $\frac{R}{2}$ from the centre of the sphere is

(a) zero (b) E

(c) $\frac{E}{2}$ (d) $\frac{E}{3}$ *(Mains 2010)*

26. Three concentric spherical shells have radii a, b and c ($a < b < c$) and have surface charge densities σ, $-\sigma$ and σ respectively. If V_A, V_B and V_C denote the potentials of the three shells, then, for $c = a + b$, we have

(a) $V_C = V_B \neq V_A$ (b) $V_C \neq V_B \neq V_A$

(c) $V_C = V_B = V_A$ (d) $V_C = V_A \neq V_B$

(Prelims 2009)

27. Three capacitors each of capacitance C and of breakdown voltage V are joined in series. The capacitance and breakdown voltage of the combination will be

(a) $3C, \frac{V}{3}$ (b) $\frac{C}{3}, 3V$

(c) $3C, 3V$ (d) $\frac{C}{3}, \frac{V}{3}$

(Prelims 2009)

28. The electric potential at a point (x, y, z) is given by $V = -x^2y - xz^3 + 4$

The electric field at that point is

(a) $\vec{E} = \hat{i}\,2xy + \hat{j}\,(x^2 + y^2) + \hat{k}\,(3xz - y^2)$

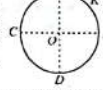
(b) $\vec{E} = \hat{i}\,z^3 + \hat{j}\,xyz + \hat{k}\,z^2$

(c) $\vec{E} = \hat{i}\,(2xy - z^3) + \hat{j}\,xy^2 + \hat{k}\,3z^2x$

(d) $\vec{E} = \hat{i}\,(2xy + z^3) + \hat{j}\,x^2 + \hat{k}\,3xz^2$

(Prelims 2009)

29. A thin conducting ring of radius R is given a charge $+Q$. The electric field at the centre O of the ring due to the charge on the part AKB of the ring is E. The electric field at the centre due to the charge on the part $ACDB$ of the ring is



(a) E along KO (b) $3E$ along OK

(c) $3E$ along KO (d) E along OK

(Prelims 2008)

30. The electric potential at a point in free space due to charge Q coulomb is $Q \times 10^{11}$ volts. The electric field at that point is

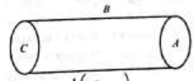
(a) $4\pi\varepsilon_0 Q \times 10^{20}$ volt/m

(b) $12\pi\varepsilon_0 Q \times 10^{22}$ volt/m

(c) $4\pi\varepsilon_0 Q \times 10^{22}$ volt/m

(d) $12\pi\varepsilon_0 Q \times 10^{20}$ volt/m *(Prelims 2008)*

31. A hollow cylinder has a charge q coulomb within it. If f is the electric flux in units of voltmeter associated with the curved surface B, the flux linked with the plane surface A in units of V-m will be



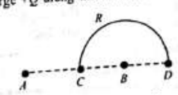
(a) $\frac{q}{2\varepsilon_0}$

(b) $\frac{\phi}{3}$

(c) $\frac{q}{\varepsilon_0} - \phi$ (d) $\frac{1}{2}\left(\frac{q}{\varepsilon_0} - \phi\right)$.

(2007)

32. Charges $+q$ and $-q$ are placed at points A and B respectively which are a distance $2L$ apart, C is the midpoint between A and B. The work done in moving a charge $+Q$ along the semicircle CRD is

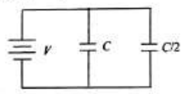


(a) $\frac{qQ}{2\pi\varepsilon_0 L}$ (b) $\frac{qQ}{6\pi\varepsilon_0 L}$

(c) $-\dfrac{qQ}{6\pi\varepsilon_0 L}$ (d) $\dfrac{qQ}{4\pi\varepsilon_0 L}$. *(2007)*

33. Three point charges $+q$, $-2q$ and $+q$ are placed at points $(x = 0, y = a, z = 0)$, $(x = 0, y = 0, z = 0)$ and $(x = a, y = 0, z = 0)$ respectively. The magnitude and direction of the electric dipole moment vector of this charge assembly are
(a) $\sqrt{2}qa$ along the line joining points $(x = 0, y = 0, z = 0)$ and $(x = a, y = a, z = 0)$
(b) qa along the line joining points $(x = 0, y = 0, z = 0)$ and $(x = a, y = a, z = 0)$
(c) $\sqrt{2}qa$ along $+x$ direction
(d) $\sqrt{2}qa$ along $+y$ direction. *(2007)*

34. Two condensers, one of capacity C and other of capacity $C/2$ are connected to a V-volt battery, as shown in the figure. The work done in charging fully both the condensers is

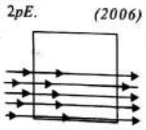


(a) $\frac{1}{4}CV^2$ (b) $\frac{3}{4}CV^2$
(c) $\frac{1}{2}CV^2$ (d) $2CV^2$. *(2007)*

35. A parallel plate air capacitor is charged to a potential difference of V volts. After disconnecting the charging battery the distance between the plates of the capacitor is increased using an insulating handle. As a result the potential difference between the plates
(a) increases (b) decreases
(c) does not change (d) becomes zero. *(2006)*

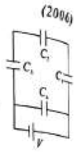
36. An electric dipole of moment $\vec{p}$ is lying along a uniform electric field $\vec{E}$. The work done in rotating the dipole by 90° is
(a) pE (b) $\sqrt{2}pE$
(c) $pE/2$ (d) $2pE$. *(2006)*

37. A square surface of side L metres is in the plane of the paper. A uniform electric field $\vec{E}$ (volt/m), also in the plane of the paper, is limited only to the lower half of the square surface (see figure). The electric flux in SI units associated with the surface is



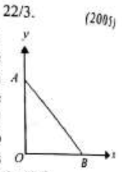
(a) EL^2 (b) $EL^2/2\varepsilon_0$
(c) $EL^2/2$ (d) zero. *(2006)*

38. A network of four capacitors of capacity equal to $C_1 = C$, $C_2 = 2C$, $C_3 = 3C$ and $C_4 = 4C$ are connected to a battery as shown in the figure. The ratio of the charges on C_2 and C_4 is



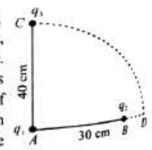
(a) 4/7 (b) 3/22
(c) 7/4 (d) 22/3. *(2005)*

39. As per the diagram a point charge $+q$ is placed at the origin O. Work done in taking another point charge $-Q$ from the point A [coordinates $(0, a)$] to another point B [coordinates $(a, 0)$] along the straight path AB is



(a) zero (b) $\left(\dfrac{qQ}{4\pi\varepsilon_0}\dfrac{1}{a^2}\right)\cdot\sqrt{2}\,a$
(c) $\left(\dfrac{-qQ}{4\pi\varepsilon_0}\dfrac{1}{a^2}\right)\cdot\sqrt{2}\,a$ (d) $\left(\dfrac{qQ}{4\pi\varepsilon_0}\dfrac{1}{a^2}\right)\cdot\dfrac{a}{\sqrt{2}}$ *(2005)*

40. Two charges q_1 and q_2 are placed 30 cm apart, as shown in the figure. A third charge q_3 is moved along the arc of a circle of radius 40cm from C to D. The change in the potential energy of the system is $\dfrac{q_3}{4\pi\varepsilon_0}k$, where k is



(a) $8q_1$ (b) $6q_1$ *(2005)*
(c) $8q_2$ (d) $6q_2$.

41. A bullet of mass 2 g is having a charge of 2 μC. Through what potential difference must it be accelerated, starting from rest, to acquire a speed of 10 m/s ?
(a) 5 kV (b) 50 kV *(2004)*
(c) 5 V (d) 50 V

42. An electric dipole has the magnitude of its charge as q and its dipole moment is p. It is placed in a uniform electric field E. If its dipole moment is along the direction of the field, the force on it and its potential energy are respectively
(a) $2q\cdot E$ and minimum
(b) $q\cdot E$ and $p\cdot E$
(c) zero and minimum
(d) $q\cdot E$ and maximum *(2004)*

43. Three capacitors each of capacity 4 μF are to be connected in such a way that the effective capacitance is 6 μF. This can be done by
(a) connecting all of them in series
(b) connecting them in parallel
(c) connecting two in series and one in parallel
(d) connecting two in parallel and one in series *(2003)*

44. A charge q is located at the centre of a cube. The electric flux through any face is
(a) $\dfrac{2\pi q}{6(4\pi\varepsilon_0)}$ (b) $\dfrac{4\pi q}{6(4\pi\varepsilon_0)}$
(c) $\dfrac{\pi q}{6(4\pi\varepsilon_0)}$ (d) $\dfrac{q}{6(4\pi\varepsilon_0)}$ *(2003)*

45. Identical charges $(-q)$ are placed at each corners of cube of side b then electrostatic potential energy of charge $(+q)$ which is placed at centre of cube will be
(a) $\dfrac{-4\sqrt{2}\,q^2}{\pi\varepsilon_0 b}$ (b) $\dfrac{-8\sqrt{2}\,q^2}{\pi\varepsilon_0 b}$
(c) $\dfrac{-4\,q^2}{\sqrt{3}\,\pi\varepsilon_0 b}$ (d) $\dfrac{8\sqrt{2}\,q^2}{4\,\pi\varepsilon_0 b}$. *(2002)*

46. A capacitor of capacity C_1 charged upto V volt and then connected to an uncharged capacitor of capacity C_2. The final potential difference across each will be
(a) $\dfrac{C_2V}{C_1+C_2}$ (b) $\dfrac{C_1V}{C_1+C_2}$
(c) $\left(1+\dfrac{C_2}{C_1}\right)$ (d) $\left(1-\dfrac{C_2}{C_1}\right)V$. *(2002)*

47. Some charge is being given to a conductor. Then its potential is
(a) maximum at surface
(b) maximum at centre

(c) remain same throughout the conductor
(d) maximum somewhere between surface and centre. *(2002)*

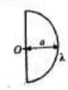
48. A dipole of dipole moment $\vec{p}$ is placed in uniform electric field $\vec{E}$ then torque acting on it is given by
(a) $\vec{\tau} = \vec{p}\cdot\vec{E}$ (b) $\vec{\tau} = \vec{p}\times\vec{E}$
(c) $\vec{\tau} = \vec{p}+\vec{E}$ (d) $\vec{\tau} = \vec{p}-\vec{E}$. *(2001)*

49. Energy per unit volume for a capacitor having area A and separation d kept at potential difference V is given by
(a) $\dfrac{1}{2}\varepsilon_0\dfrac{V^2}{d^2}$ (b) $\dfrac{1}{2\varepsilon_0}\dfrac{V^2}{d^2}$
(c) $\dfrac{1}{2}CV^2$ (d) $\dfrac{Q^2}{2C}$. *(2001)*

50. A charge Q μC is placed at the centre of a cube, the flux coming out from each face will be
(a) $\dfrac{Q}{6\varepsilon_0}\times10^{-6}$ (b) $\dfrac{Q}{6\varepsilon_0}\times10^{-3}$
(c) $\dfrac{Q}{24\varepsilon_0}$ (d) $\dfrac{Q}{8\varepsilon_0}$. *(2001)*

51. A charge Q is situated at the corner of a cube, the electric flux passed through all the six faces of the cube is
(a) $\dfrac{Q}{6\varepsilon_0}$ (b) $\dfrac{Q}{8\varepsilon_0}$
(c) $\dfrac{Q}{\varepsilon_0}$ (d) $\dfrac{Q}{2\varepsilon_0}$. *(2000)*

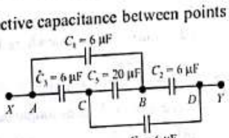
52. Electric field at centre O of semicircle of radius a having linear charge density λ given as



(a) $\dfrac{2\lambda}{\varepsilon_0 a}$ (b) $\dfrac{\lambda\pi}{\varepsilon_0 a}$
(c) $\dfrac{\lambda}{2\pi\varepsilon_0 a}$ (d) $\dfrac{\lambda}{\pi\varepsilon_0 a}$. *(2000)*

53. A capacitor is charged with a battery and energy stored is U. After disconnecting battery another capacitor of same capacity is connected in parallel to the first capacitor. Then energy stored in each capacitor is
(a) $U/2$ (b) $U/4$
(c) $4U$ (d) $2U$. *(2000)*

54. What is the effective capacitance between points X and Y?



(a) $12\ \mu F$
(b) $18\ \mu F$
(c) $24\ \mu F$
(d) $6\ \mu F$ *(1999)*

55. When air is replaced by a dielectric medium of constant K, the maximum force of attraction between two charges separated by a distance
(a) increases K times
(b) remains unchanged
(c) decreases K times
(d) increases K^{-1} times. *(1999)*

56. In bringing an electron towards another electron, the electrostatic potential energy of the system
(a) becomes zero (b) increases
(c) decreases (d) remains same *(1999)*

57. A parallel plate condenser with oil between the plates (dielectric constant of oil $K = 2$) has a capacitance C. If the oil is removed, then capacitance of the capacitor becomes
(a) $\frac{C}{\sqrt{2}}$ (b) $2C$
(c) $\sqrt{2}\,C$ (d) $\frac{C}{2}$ *(1999)*

58. A hollow insulated conduction sphere is given a positive charge of $10\ \mu C$. What will be the electric field at the centre of the sphere if its radius is 2 metres?
(a) $20\ \mu C\ m^{-2}$ (b) $5\ \mu C\ m^{-2}$
(c) zero (d) $8\ \mu C\ m^{-2}$ *(1998)*

59. A particle of mass m and charge q is placed at rest in a uniform electric field E and then released. The kinetic energy attained by the particle after moving a distance y is
(a) qEy (b) qE^2y
(c) qEy^2 (d) q^2Ey *(1998)*

60. A point Q lies on the perpendicular bisector of an electrical dipole of dipole moment p. If the distance of Q from the dipole is r (much larger than the size of the dipole), then the electric field at Q is proportional to
(a) p^2 and r^{-3} (b) p and r^{-2}
(c) p^{-1} and r^{-2} (d) p and r^{-3} *(1998)*

61. A point charge $+q$ is placed at the centre of a cube of side l. The electric flux emerging from the cube is
(a) $\frac{6ql^2}{\varepsilon_0}$ (b) $\frac{q}{6l^2\varepsilon_0}$
(c) zero (d) $\frac{q}{\varepsilon_0}$. *(1996)*

62. The energy stored in a capacitor of capacity C and potential V is given by
(a) $\frac{CV}{2}$ (b) $\frac{C^2V^2}{2}$
(c) $\frac{C^2V}{2}$ (d) $\frac{CV^2}{2}$. *(1996)*

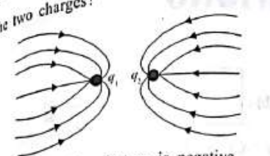
63. Two metallic spheres of radii 1 cm and 2 cm are given charges 10^{-2} C and 5×10^{-2} C respectively. If they are connected by a conducting wire, the final charge on the smaller sphere is
(a) 3×10^{-2} C (b) 4×10^{-2} C
(c) 1×10^{-2} C (d) 2×10^{-2} C. *(1995)*

64. There is an electric field E in x-direction. If the work done on moving a charge of 0.2 C through a distance of 2 m along a line making an angle 60° with x-axis is 4 J, then what is the value of E?
(a) 5 N/C (b) 20 N/C
(c) $\sqrt{3}$ N/C (d) 4 N/C. *(1995)*

65. A charge q is placed at the centre of the line joining two exactly equal positive charges Q. The system of three charges will be in equilibrium, if q is equal to
(a) $-Q$ (b) $Q/2$
(c) $-Q/4$ (d) $+Q$. *(1995)*

66. An electric dipole of moment p is placed in the position of stable equilibrium in uniform electric field of intensity E. This is rotated through an angle θ from the initial position. The potential energy of the electric dipole in the final position is
(a) $-pE\cos\theta$ (b) $pE(1 - \cos\theta)$
(c) $pE\cos\theta$ (d) $pE\sin\theta$. *(1994)*

67. The given figure gives electric lines of force due to two charges q_1 and q_2. What are the signs of the two charges?



(a) q_1 is positive but q_2 is negative
(b) q_1 is negative but q_2 is positive
(c) both are negative
(d) both are positive. *(1994)*

68. Charge q_2 is at the centre of a circular path with radius r. Work done in carrying charge q_1, once around this equipotential path, would be
(a) $\frac{1}{4\pi\varepsilon_0} \times \frac{q_1q_2}{r^2}$ (b) $\frac{1}{4\pi\varepsilon_0} \times \frac{q_1q_2}{r}$
(c) zero (d) infinite. *(1994)*

69. A hollow metallic sphere of radius 10 cm is charged such that potential of its surface is 80 V. The potential at the centre of the sphere would be
(a) 80 V (b) 800 V
(c) zero (d) 8 V. *(1994)*

70. Point charges $+4q$, $-q$ and $+4q$ are kept on the X-axis at point $x = 0$, $x = a$ and $x = 2a$ respectively.
(a) only $-q$ is in stable equilibrium
(b) all the charges are in stable equilbrium
(c) all of the charges are in unstable equilibrium
(d) none of the charges is in equilibrium *(1988)*

EXPLANATIONS

1. **(d):** Force of attraction between the plates of the parallel plate air capacitor is

$$F = \frac{Q^2}{2\varepsilon_0 A}$$

where Q is the charge on the capacitor, ε_0 is the permittivity of free space and A is the area of each plate.

But $Q = CV$

and $C = \frac{\varepsilon_0 A}{d}$ or $\varepsilon_0 A = Cd$

$$\therefore \quad F = \frac{C^2V^2}{2Cd} = \frac{CV^2}{2d}$$

2. **(d) :** The electric field $\vec{E}$ and potential V in a region are related as

$$\vec{E} = -\left[\frac{\partial V}{\partial x}\hat{i} + \frac{\partial V}{\partial y}\hat{j} + \frac{\partial V}{\partial z}\hat{k}\right]$$

Here, $V(x, y, z) = 6xy - y + 2yz$

$$\therefore \quad \vec{E} = -\left[\frac{\partial}{\partial x}(6xy - y + 2yz)\hat{i} + \frac{\partial}{\partial y}(6xy - y + 2yz)\hat{j} + \frac{\partial}{\partial z}(6xy - y + 2yz)\hat{k}\right]$$

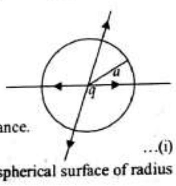
$$= -[(6y)\hat{i} + (6x - 1 + 2z)\hat{k} + (2y)\hat{k}]$$

At point (1, 1, 0),

$$\vec{E} = -[(6(1))\hat{i} + (6(1) - 1 + 2(0))\hat{j} + (2(1))\hat{k}]$$

$$= -(6\hat{i} + 5\hat{j} + 2\hat{k})$$

3. **(a) :** According to question, electric field varies as



$E = Ar$

Here r is the radial distance.

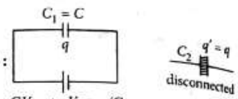
At $r = a$, $E = Aa$ ...(i)

Net flux emitted from a spherical surface of radius a is $\phi_{net} = \frac{q_{en}}{\varepsilon_0}$

$\Rightarrow \quad (Aa) \times (4\pi a^2) = \frac{q}{\varepsilon_0}$ [Using equation (i)]

$\therefore \; q = 4\pi\varepsilon_0 A a^3$

4. **(b) :**



$q = CV \Rightarrow V = q/C$

Due to dielectric insertion, new capacitance $C_2 = CK$

Initial energy stored in capacitor, $U_1 = \frac{q^2}{2C}$

Final energy stored in capacitor, $U_2 = \frac{q^2}{2KC}$

Change in energy stored, $\Delta U = U_2 - U_1$

$$\Delta U = \frac{q^2}{2C}\left(\frac{1}{K} - 1\right) = \frac{1}{2}CV^2\left(\frac{1}{K} - 1\right)$$

New potential difference between plates

$$V' = \frac{q}{CK} = \frac{V}{K}$$

5. **(c)**

6. **(b) :** For the conducting sphere,

Potential at the centre = Potential on the sphere

$$= \frac{1}{4\pi\varepsilon_0}\frac{Q}{R}$$

Electric field at the centre = 0

7. **(d) :** Here, $V(x, y, z) = 6x - 8xy - 8y + 6yz$

The x, y and z components of electric field are

$$E_x = -\frac{\partial V}{\partial x} = -\frac{\partial}{\partial x}(6x - 8xy - 8y + 6yz)$$
$$= -(6 - 8y) = -6 + 8y$$

$$E_y = -\frac{\partial V}{\partial y} = -\frac{\partial}{\partial y}(6x - 8xy - 8y + 6yz)$$
$$= -(-8x - 8 + 6z) = 8x + 8 - 6z$$

$$E_z = -\frac{\partial V}{\partial z} = -\frac{\partial}{\partial z}(6x - 8xy - 8y + 6yz) = -6y$$

$$\vec{E} = E_x\hat{i} + E_y\hat{j} + E_z\hat{k}$$

$$= (-6 + 8y)\hat{i} + (8x + 8 - 6z)\hat{j} - 6y\hat{k}$$

At point (1, 1, 1)

$$\vec{E} = (-6 + 8)\hat{i} + (8 + 8 - 6)\hat{j} - 6\hat{k}$$
$$= 2\hat{i} + 10\hat{j} - 6\hat{k}$$

The magnitude of electric field $\vec{E}$ is

$$E = \sqrt{E_x^2 + E_y^2 + E_z^2} = \sqrt{(2)^2 + (10)^2 + (-6)^2}$$
$$= \sqrt{140} = 2\sqrt{35} \text{ N C}^{-1}$$

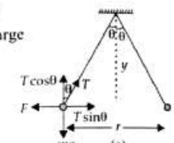
Electric force experienced by the charge

$$F = qE = 2\text{ C} \times 2\sqrt{35}\text{ N C}^{-1} = 4\sqrt{35}\text{ N}$$

8. **(d) :** In the direction of electric field, electric potential decreases.

$\therefore \quad V_B > V_C > V_A$

9. **(d) :** Let m be mass of each ball and q be charge on each ball.



(a)

Force of repulsion,

$$F = \frac{1}{4\pi\varepsilon_0}\frac{q^2}{r^2}$$

In equilibrium

$T\cos\theta = mg$ ...(i)

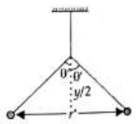
$T\sin\theta = F$ ...(ii)

Divide (ii) by (i), we get

$$\tan\theta = \frac{F}{mg} = \frac{\frac{1}{4\pi\varepsilon_0}\frac{q}{r^2}}{mg}$$

From figure (a),

$$\frac{r/2}{y} = \frac{\frac{1}{4\pi\varepsilon_0}\frac{q}{r^2}}{mg} \quad ...(iii)$$



(b)

$$\tan\theta' = \frac{\frac{1}{4\pi\varepsilon_0}\frac{q^2}{r'^2}}{mg}$$

From figure (b)

$$\frac{r'/2}{y/2} = \frac{\frac{1}{4\pi\varepsilon_0}\frac{q^2}{r'^2}}{mg} \quad ...(iv)$$

Divide (iv) by (iii), we get

$$\frac{2r'}{r} = \frac{r^2}{r'^2}$$

$$r'^3 = \frac{r^3}{2}$$

$$r' = \frac{r}{\sqrt[3]{2}}$$

10. **(b) :** Potential energy of dipole,

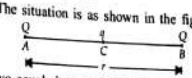
$U = -pE(\cos\theta_2 - \cos\theta_1)$

Here, $\theta_1 = 0°$, $\theta_2 = 90°$

$\therefore \quad U = -pE(\cos 90° - \cos 0°)$

$= -pE(0 - 1) = pE$

11. **(a) :** The situation is as shown in the figure.



Let two equal charges Q each placed at points A and B at a distance r apart. C is the centre of AB where charge q is placed.

For equilibrium, net force on charge $Q = 0$

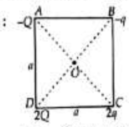
$$\therefore \quad \frac{1}{4\pi\varepsilon_0}\frac{QQ}{r^2} + \frac{1}{4\pi\varepsilon_0}\frac{Qq}{(r/2)^2} = 0$$

$$\frac{1}{4\pi\varepsilon_0}\frac{Q^2}{r^2} = -\frac{1}{4\pi\varepsilon_0}\frac{4Qq}{r^2} \text{ or } Q = -4q \text{ or } q = -\frac{Q}{4}$$

12. **(a) :** Torque, $\tau = pE\sin\theta$

Potential energy, $U = -pE\cos\theta$

13. **(a) :**



Let a be the side length of the square $ABCD$.

$$\therefore \quad AC = BD = \sqrt{a^2 + a^2} = a\sqrt{2}$$

$$OA = OB = OC = OD = \frac{a\sqrt{2}}{2} = \frac{a}{\sqrt{2}}$$

Potential is a scalar quantity.

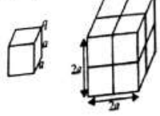
Potential at the centre O due to given charge configuration is

$$V = \frac{1}{4\pi\varepsilon_0}\left[\frac{(-Q)}{\left(\frac{a}{\sqrt{2}}\right)} + \frac{(-q)}{\left(\frac{a}{\sqrt{2}}\right)} + \frac{(2q)}{\left(\frac{a}{\sqrt{2}}\right)} + \frac{2Q}{\left(\frac{a}{\sqrt{2}}\right)}\right] = 0$$

$\Rightarrow \quad -Q - q + 2q + 2Q = 0$

or $\quad Q + q = 0$ or $Q = -q$

14. **(b) :**



Eight identical cubes are required so that the given charge q appears at the centre of the bigger cube. Thus, the electric flux passing through the given cube is

$$\phi = \frac{1}{8}\left(\frac{q}{\varepsilon_0}\right) = \frac{q}{8\varepsilon_0}$$

15. **(c) :** Capacitance of a parallel plate capacitor is

$$C = \frac{\varepsilon_0 A}{d} \quad ...(i)$$

Potential difference between the plates is

$$V = Ed \quad ...(ii)$$

The energy stored in the capacitor is

$$U = \frac{1}{2}CV^2 = \frac{1}{2}\left(\frac{\varepsilon_0 A}{d}\right)(Ed)^2 \text{ (Using (i) and (ii))}$$

$$= \frac{1}{2}\varepsilon_0 E^2 Ad$$

16. **(b) :** When the given metallic spheres are connected by a conducting wire, charge will flow till both the spheres acquire a common potential which is given by

Common potential,

$$V = \frac{q_1 + q_2}{C_1 + C_2} = \frac{-1\times10^{-2} + 5\times10^{-2}}{4\pi\varepsilon_0 R_1 + 4\pi\varepsilon_0 R_2}$$

$$= \frac{4\times10^{-2}}{4\pi\varepsilon_0(1\times10^{-2} + 3\times10^{-2})}$$

$$= \frac{4\times10^{-2}}{4\pi\varepsilon_0 \times 4\times10^{-2}} \quad ...(i)$$

$\therefore$ Final charge on the bigger sphere is

$$= 4\pi\varepsilon_0 \times 3\times10^{-2} \times \frac{4\times10^{-2}}{4\pi\varepsilon_0 \times 4\times10^{-2}} \text{ (Using (i))}$$

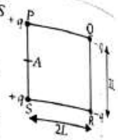
$$= 3\times10^{-2}\,C$$

17. **(c) :** According to Gauss's law

$$\phi_E = \frac{Q_{\text{enclosed}}}{\varepsilon_0}$$

If the radius of the Gaussian surface is doubled, the outward electric flux will remain the same. This is because electric flux depends only on the charge enclosed by the surface.

18. **(c) :** A is the midpoint of PS



$\therefore \quad PA = AS = L$

$$AR = AQ = \sqrt{(SR)^2 + (AS)^2}$$

$$= \sqrt{(2L)^2 + (L)^2} = L\sqrt{5}$$

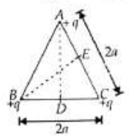
Electric potential at point A due to the given charge configuration is

$$V_A = \frac{1}{4\pi\varepsilon_0}\left[\frac{q}{PA} + \frac{q}{AS} + \frac{(-q)}{AQ} + \frac{(-q)}{AR}\right]$$

$$= \frac{1}{4\pi\varepsilon_0}\left[\frac{q}{L} + \frac{q}{L} - \frac{q}{L\sqrt{5}} - \frac{q}{L\sqrt{5}}\right]$$

$$= \frac{1}{4\pi\varepsilon_0}\left[\frac{2q}{L} - \frac{2q}{L\sqrt{5}}\right] = \frac{1}{4\pi\varepsilon_0}\frac{2q}{L}\left[1 - \frac{1}{\sqrt{5}}\right]$$

19. **(d) :**



Here, $AC = BC = 2a$

D and E are the midpoints of BC and AC.

$\therefore \quad AE = EC = a$ and $BD = DC = a$

In ΔADC, $(AD)^2 = (AC)^2 - (DC)^2$

$$= (2a)^2 - (a)^2 = 4a^2 - a^2 = 3a^2$$

$$AD = a\sqrt{3}$$

Similarly,

Potential at point D due to the given charge configuration is

$$V_D = \frac{1}{4\pi\varepsilon_0}\left[\frac{q}{BD} + \frac{q}{DC} + \frac{q}{AD}\right]$$

$$= \frac{q}{4\pi\varepsilon_0}\left[\frac{1}{a} + \frac{1}{a} + \frac{1}{\sqrt{3}a}\right] = \frac{q}{4\pi\varepsilon_0 a}\left[2 + \frac{1}{\sqrt{3}}\right] \quad ...(i)$$

Potential at point E due to the given charge configuration is

$$V_E = \frac{1}{4\pi\varepsilon_0}\left[\frac{q}{AE} + \frac{q}{EC} + \frac{q}{BE}\right]$$

$$= \frac{q}{4\pi\varepsilon_0}\left[\frac{1}{a} + \frac{1}{a} + \frac{1}{a\sqrt{3}}\right] = \frac{q}{4\pi\varepsilon_0 a}\left[2 + \frac{1}{\sqrt{3}}\right] \quad ...(ii)$$

From the (i) and (ii), it is clear that

$$V_D = V_E$$

The work done in taking a charge Q from D to E is

$$W = Q(V_E - V_D) = 0 \qquad (\because V_D = V_E)$$

20. **(a) :** $\vec{E} = -\vec{\nabla}V$

where $\vec{\nabla} = \hat{i}\frac{\partial}{\partial x} + \hat{j}\frac{\partial}{\partial y} + \hat{k}\frac{\partial}{\partial z}$

$$\therefore \vec{E} = -\left[\hat{i}\frac{\partial V}{\partial x} + \hat{j}\frac{\partial V}{\partial y} + \hat{k}\frac{\partial V}{\partial z}\right]$$

Here, $V = 4x^2 \quad \therefore \quad \vec{E} = -8x\hat{i}$

The electric field at point (1, 0, 2) is

$$\vec{E}_{(1,0,2)} = -8\hat{i}\ \text{V m}^{-1}$$

So electric field is along the negative X-axis.

21. **(c) :** According to Coulomb's law, the force of repulsion between the two positive ions each of charge q, separated by a distance d is given by

$$F = \frac{1}{4\pi\varepsilon_0}\frac{(q)(q)}{d^2}$$

$$F = \frac{q^2}{4\pi\varepsilon_0 d^2}$$

$$q^2 = 4\pi\varepsilon_0 Fd^2$$

$$q = \sqrt{4\pi\varepsilon_0 Fd^2} \quad ...(i)$$

Since, $q = ne$

where,

n = number of electrons missing from each ion

e = magnitude of charge on electron

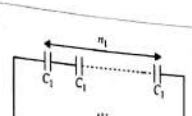
$$\therefore \quad n = \frac{q}{e}$$

$$n = \frac{\sqrt{4\pi\varepsilon_0 Fd^2}}{e} \quad \text{(Using (i))}$$

$$= \sqrt{\frac{4\pi\varepsilon_0 Fd^2}{e^2}}$$

22. **(d)**

23. **(d) :** A series combination of n_1 capacitors each of capacitance C_1 are connected to $4V$ source as shown in the figure.



Total capacitance of the series combination of the capacitors is

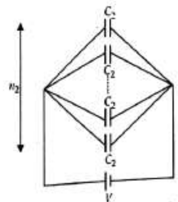
$$\frac{1}{C_s} = \frac{1}{C_1} + \frac{1}{C_1} + \frac{1}{C_1} + \text{.........upto } n_1 \text{ terms} = \frac{n_1}{C_1}$$

or $C_s = \frac{C_1}{n_1}$ ...(i)

Total energy stored in a series combination of the capacitors is

$$U_s = \frac{1}{2}C_s(4V)^2 = \frac{1}{2}\left(\frac{C_1}{n_1}\right)(4V)^2 \text{ (Using (i)) } ...(ii)$$

A parallel combination of n_2 capacitors each of capacitance C_2 are connected to V source as shown in the figure.



Total capacitance of the parallel combination of capacitors is

$$C_p = C_2 + C_2 + \text{..........} + \text{ upto } n_2 \text{ terms} = n_2 C_2$$

or $C_p = n_2 C_2$ ...(iii)

Total energy stored in a parallel combination of capacitors is

$$U_p = \frac{1}{2}C_p V^2$$

$$= \frac{1}{2}(n_2 C_2)(V)^2 \quad \text{(Using (iii))...(iv)}$$

According to the given problem,

$$U_s = U_p$$

Substituting the values of U_i and U_f from equations (ii) and (iv), we get

$$\frac{1}{2}\frac{C_1}{n_1}(4V)^2=\frac{1}{2}(n_2C_2)(V)^2$$

or $\frac{C_1 16}{n_1}=n_2C_2$ or $C_2=\frac{16C_1}{n_1n_2}$

24. **(c)** : Electric field between two parallel plates placed in vacuum is given by

$$E=\frac{\sigma}{\varepsilon_0}$$

In a medium of dielectric constant K, $E'=\frac{\sigma}{\varepsilon_0 K}$

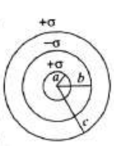
For kerosene oil $K>1 \Rightarrow E'<E$

25. **(a)** : Electric field inside a charged conductor is always zero.

26. **(d)** : $V_A=\frac{1}{4\pi\varepsilon_0}\left\{\frac{q_A}{a}+\frac{q_B}{b}+\frac{q_C}{c}\right\}$

$$=\frac{4\pi}{4\pi\varepsilon_0}\left\{\frac{a^2\sigma}{a}-\frac{b^2\sigma}{b}+\frac{c^2\sigma}{c}\right\}$$

$$V_A=\frac{1}{\varepsilon_0}\left\{\frac{a^2\sigma}{a}-\frac{b^2\sigma}{b}+\frac{c^2\sigma}{c}\right\}$$



$$V_B=\frac{1}{\varepsilon_0}\left\{\frac{a^2\sigma}{b}-\frac{b^2\sigma}{b}+\frac{c^2\sigma}{c}\right\}$$

$$V_C=\frac{1}{\varepsilon_0}\left\{\frac{a^2\sigma}{c}-\frac{b^2\sigma}{c}+\frac{c^2\sigma}{c}\right\}$$

Given $c=a+b$.

If $a=a$, $b=2a$ and $c=3a$ for example, as $c>b>a$,

$$V_A=\frac{1}{\varepsilon_0}\left\{\frac{a^2\sigma}{a}-\frac{4a^2\sigma}{2a}+\frac{c^2\sigma}{c}\right\}$$

$$V_B=\frac{1}{\varepsilon_0}\left\{\frac{a^2\sigma}{2a}-\frac{4a^2\sigma}{2a}+\frac{c^2\sigma}{c}\right\}$$

$$V_C=\frac{1}{\varepsilon_0}\left\{\frac{a^2\sigma}{3a}-\frac{4a^2\sigma}{3a}+\frac{c^2\sigma}{c}\right\}$$

It can seen by taking out common factors that $V_A=V_C>V_B$ i.e., $V_A=V_C\neq V_B$

27. **(b)** : Three capacitors of capacitance C each are in series.

$\therefore$ Total capacitance, $C_{total}=\frac{C}{3}$

The charge is the same, Q, when capacitors are in series.

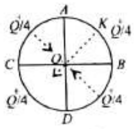
$$V_{total}=\frac{Q}{C}=\frac{Q}{C/3}=3V.$$

28. **(d)** : The electric potential at a point, $V=-x^2y-xz^3+4$.

The field $\vec{E}=-\vec{\nabla}V=-\left(\frac{\partial V}{\partial x}\hat{i}+\frac{\partial V}{\partial y}\hat{j}+\frac{\partial V}{\partial z}\hat{k}\right)$

$\therefore\ \vec{E}=\hat{i}(2xy+z^3)+\hat{j}x^2+\hat{k}(3xz^2)$

29. **(d)** :



The fields at O due to AC and BD cancel each other.

The field due to CD is acting in the direction OK and equal in magnitude to E due to AKB.

30. **(c)** : $V=\frac{1}{4\pi\varepsilon_0}\cdot\frac{Q}{r}=Q.10^{11}$ volts ;

$\therefore\ \frac{1}{r}=4\pi\varepsilon_0\,10^{11}$

$E=\frac{\text{potential}}{r}=Q\cdot10^{11}\times4\pi\varepsilon_0\cdot10^{11}$

$\Rightarrow\ E=4\pi\varepsilon_0\cdot Q\cdot10^{22}$ volt/m

31. **(d)** : Let f_A, f_B and f_C are the electric flux linked with A, B and C.

According to Gauss theorem,

$\phi_A+\phi_B+\phi_C=\frac{q}{\varepsilon_0}$

Since $\phi_A=\phi_C$,

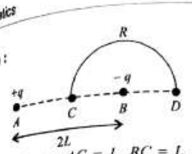
$\therefore\ 2\phi_A+\phi_B=\frac{q}{\varepsilon_0}$

or $2\phi_A=\frac{q}{\varepsilon_0}-\phi_B$

or, $2\phi_A=\frac{q}{\varepsilon_0}-\phi$ (Given $\phi_B=\phi$)

$\therefore\ \phi_A=\frac{1}{2}\left(\frac{q}{\varepsilon_0}-\phi\right)$.

32. **(c)** :



From figure, $AC=L$, $BC=L$, $BD=BC=L$

$AD=AB+BD=2L+L=3L$

Potential at C is given by

$$V_C=\frac{1}{4\pi\varepsilon_0}\left[\frac{q}{AC}+\frac{(-q)}{BC}\right]=\frac{1}{4\pi\varepsilon_0}\left[\frac{q}{L}-\frac{q}{L}\right]=0$$

Potential at D is given by

$$V_D=\frac{1}{4\pi\varepsilon_0}\left[\frac{q}{AD}+\frac{(-q)}{BD}\right]=\frac{1}{4\pi\varepsilon_0}\left[\frac{q}{3L}-\frac{q}{L}\right]$$

$$=\frac{1}{4\pi\varepsilon_0}\frac{q}{L}\left[\frac{1}{3}-1\right]=\frac{-q}{6\pi\varepsilon_0}.$$

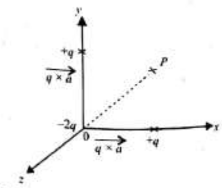
Work done in moving charge $+Q$ along the semicircle CRD is given by

$$W=[V_D-V_C](+Q)=\left[\frac{-q}{6\pi\varepsilon_0}-0\right](Q)=\frac{-qQ}{6\pi\varepsilon_0 L}$$

Comments : Potential at C is zero because the charges are equal and opposite and the distances are the same.

Potential at D due to $-q$ is greater than that at $A(+q)$, because D is closer to B. Therefore it is negative.

33. **(a)** : This consists of two dipoles, $-q$ and $+q$ with dipole moment along with the $+y$-direction and $-q$ and $+q$ along the x-direction.



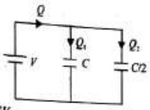
$\therefore$ The resultant moment $=\sqrt{q^2a^2+q^2a^2}=\sqrt{2}qa$.

Along the direction 45° that is along OP where P is $(+a, +a, 0)$.

34. **(b)** : As the capacitors are connected in parallel, therefore potential difference across both the condensors remains the same.

$\therefore\ Q_1=CV$;

$Q_2=\frac{C}{2}V$



Also, $Q=Q_1+Q_2$

$=CV+\frac{C}{2}V=\frac{3}{2}CV$.

Work done in charging fully both the condensors is given by

$$W=\frac{1}{2}QV=\frac{1}{2}\times\left(\frac{3}{2}CV\right)V=\frac{3}{4}CV^2.$$

35. **(a)** : Capacitance of a parallel plate capacitor

$$C=\frac{\varepsilon_0 A}{d} \quad \text{...(i)}$$

Also capacitance $=\frac{\text{potential difference}}{\text{charge}}$ ...(ii)

When battery is disconnected and the distance between the plates of the capacitor is increased then capacitance increases and charge remains constant.

Since capacitance $=\frac{\text{potential difference}}{\text{charge}}$

$\therefore$ Potential difference increases.

36. **(a)** : Work done in deflecting a dipole through an angle θ is given by

$$W=\int_0^\theta pE\sin\theta d\theta=pE(1-\cos\theta)$$

Since $\theta=90°$

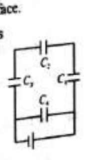
$\therefore\ W=pE(1-\cos90°)$ or, $W=pE$.

37. **(d)** : Electric flux, $\phi_E=\int\vec{E}\cdot d\vec{S}$

$=\int EdS\cos\theta=\int EdS\cos90°=0.$

The lines are parallel to the surface.

38. **(b)** : C_1, C_2 and C_3 are in series



$\frac{1}{C'}=\frac{1}{C}+\frac{1}{2C}+\frac{1}{3C}$

or, $\frac{1}{C'}=\frac{6+3+2}{6C}=\frac{11}{6C}$

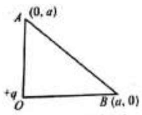
or, $C'=\frac{6C}{11}$

All the capacitors in branch 1 is in series so the charge on each capacitor is $Q' = \frac{6}{11}CV$

Also charge on capacitor C_4 is $Q = 4CV$

$\therefore$ Ratio $= \frac{Q'}{Q} = \frac{6CV}{11 \times 4CV} = \frac{3}{22}$.

39. **(a)** : Work done is equal to zero because the potential of A and B are the same $= \frac{1}{4\pi\varepsilon_0}\frac{q}{a}$



No work is done if a particle does not change its potential energy.

i.e. initial potential energy = final potential energy.

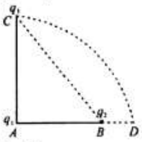
40. **(c)** : The potential energy when q_3 is at point C

$$U_1 = \frac{1}{4\pi\varepsilon_0}\left[\frac{q_1q_3}{0.40} + \frac{q_2q_3}{\sqrt{(0.40)^2 + (0.30)^2}}\right]$$

The potential energy when q_3 is at point D

$$U_2 = \frac{1}{4\pi\varepsilon_0}\left[\frac{q_1q_3}{0.40} + \frac{q_2q_3}{0.10}\right]$$

Thus change in potential energy is



$$\Delta U = U_2 - U_1$$

$$\Rightarrow \frac{q_3}{4\pi\varepsilon_0}k$$

$$= \frac{1}{4\pi\varepsilon_0}\left[\frac{q_1q_3}{0.40} + \frac{q_2q_3}{0.10} - \frac{q_1q_3}{0.40} - \frac{q_2q_3}{0.50}\right]$$

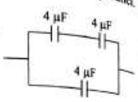
$$\Rightarrow k = \frac{5q_2 - q_2}{0.50} = \frac{4q_2}{0.50} = 8q_2.$$

41. **(b)** : Using $\frac{1}{2}mv^2 = qV$

$$V = \frac{1}{2} \times \frac{2\times10^{-3}\times10\times10}{2\times10^{-6}} = 50\text{ kV}.$$

42. **(c)** : The total force on dipole is zero because $F = qE$ is applied on each charge but in opposite direction. The potential energy is $U = -\vec{p}\cdot\vec{E}$, which is minimum when $\vec{p}$ and $\vec{E}$ are parallel.

43. **(c)** : To get equivalent capacitance 6 μF. Out of the 4 μF capacitance, two are connected in series and third one is connected in parallel.



$$C_{eq} = \frac{4\times4}{4+4} + 4 = 2 + 4 = 6\ \mu\text{F}.$$

44. **(b)** : The total flux through the cube $\phi_{total} = \frac{q}{\varepsilon_0}$

$\therefore$ the electric flux through any face

$$\phi_{face} = \frac{q}{6\,\varepsilon_0} = \frac{4\pi q}{6(4\pi\varepsilon_0)}.$$

45. **(c)** : There are eight corners of a cube and in each corner there is a charge of $(-q)$. At the centre of the corner there is a charge of $(+q)$. Each corner is equidistant from the centres of the cube and the distance (d) is half of the diagonals of the cube.

Diagonal of the cube $= \sqrt{b^2 + b^2 + b^2} = \sqrt{3}\,b$

$\therefore d = \sqrt{3}\,b/2$

Now, electric potential energy of the charge $(+q)$ due to a charge $(-q)$ at one corner $= U$

$$= \frac{q_1q_2}{4\pi\varepsilon_0 r} = \frac{(+q)\times(-q)}{4\pi\varepsilon_0(\sqrt{3}b/2)} = -\frac{q^2}{2\pi\varepsilon_0(\sqrt{3}b)}.$$

$\therefore$ Total electric potential energy due to all the eight identical charges $= 8U = -\frac{8q^2}{2\pi\varepsilon_0\sqrt{3}b} = \frac{-4q^2}{\sqrt{3}\,\pi\varepsilon_0 b}$.

46. **(b)** : Charge on first capacitor $= q_1 = C_1V$

Charge on second capacitor $= q_2 = 0$

When they are connected, in parallel the total charge

$q = q_1 + q_2$. $\therefore q = C_1V$.

and capacitance, $C = C_1 + C_2$

Let V' be the common potential difference across each capacitor, then $q = CV'$.

$$\therefore V' = \frac{q}{C} = \frac{C_1}{C_1 + C_2}V.$$

47. **(c)** : Electric field intensity E is zero within a conductor due to charge given to it.

Also, $E = -\frac{dV}{dx}$ or $\frac{dV}{dx} = 0$. (inside the conductor)

$\therefore V$ = constant. [V is potential]

So potential remains same throughout the conductor.

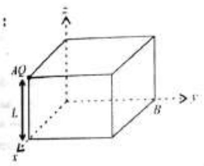
48. **(b)** : When an electric dipole is placed in a uniform electrical field $\vec{E}$, the torque on the dipole is given by $\vec{\tau} = \vec{p}\times\vec{E}$

49. **(a)** : Energy density $= \frac{1}{2}\varepsilon_0\frac{V^2}{d^2}$

50. **(a)** : For complete cube $\phi = \frac{Q}{\varepsilon_0}\times10^{-6}$

For each face $\phi = \frac{1}{6}\frac{Q}{\varepsilon_0}\times10^{-6}$

51. **(b)** :



As at a corner, 8 cubes can be placed symmetrically, flux linked with each cube (due to a charge Q at the corner) will be $\frac{Q}{8\varepsilon_0}$.

Now for the faces passing through the edge A, electric field E at a face will be parallel to area of face and so flux for these three faces will be zero. Now as the cube has six faces and flux linked with three faces (through A) is zero, so flux linked with remaining three faces will be $\frac{Q}{8\varepsilon_0}$

Hence, electric flux passed through all the six faces of the cube is $\frac{Q}{8\varepsilon_0}$

52. **(c)**

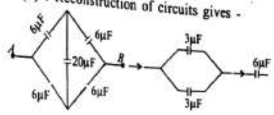
53. **(b)** : Let q be the charge on each capacitor.

$\therefore$ Energy stored, $U = \frac{1}{2}CV^2 = \frac{1}{2}\frac{q^2}{C}$

Now, when battery is disconnected and another capacitor of same capacity is connected in parallel to the first capacitor, then voltage across each capacitor, $V = \frac{q}{2C}$

$\therefore$ Energy stored $= \frac{1}{2}C\left(\frac{q}{2C}\right)^2 = \frac{1}{4}\cdot\frac{1}{2}\frac{q^2}{C} = \frac{1}{4}U$.

54. **(d)** : Reconstruction of circuits gives -



55. **(c)** : $F_m = \frac{F_0}{K}$ *i.e.*, decreases K times

56. **(b)** : In bringing an electron towards another electron, work has to be done (since same charges repel each other). The work done stored as electrostatic potential energy, and hence, electrostatic potential energy of the system increases.

57. **(d)** : Capacitance of capacitor with oil between the plate, $C = \frac{K\varepsilon_0 A}{d}$

If oil is removed capacitance, $C' = \frac{\varepsilon_0 A}{d} = \frac{C}{K} = \frac{C}{2}$

58. **(c)** : Field inside a conducting sphere = 0.

59. **(a)** : As $v^2 = 0^2 + 2ay = 2\,(F/m)\,y = 2\left(\frac{qE}{m}\right)y$

K.E. $= \frac{1}{2}mv^2$

$\therefore$ K.E. $= \frac{1}{2}m\left[2\frac{(qE)}{m}y\right] \Rightarrow$ K.E. $= qEy$

60. **(d)** : The electric field at a point on equatorial line (perpendicular bisector) of dipole at a distance r is given by, $E = \frac{p}{4\pi\varepsilon_0}\cdot\frac{1}{(r^2 + a^2)^{3/2}}$

where $2a$ = length of dipole $(\because r >> a)$

$\therefore E = \frac{p}{4\pi\varepsilon_0}\cdot\frac{1}{r^3}$. *i.e.* $E \propto p$ and $E \propto r^{-3}$.

61. **(d)** : Electric flux emerging from the cube does not depend on size of cube.

Total flux $= \frac{q}{\varepsilon_0}$.

62. **(d)**

63. **(d)** : Radii of sphere $(R_1) = 1$ cm $= 1\times10^{-2}$ m; $(R_2) = 2$ cm $= 2\times10^{-2}$ m and charges on sphere;

$(Q_1) = 10^{-2}$C and $(Q_2) = 5 \times 10^{-2}$ C.

Common potential (V)

$$= \frac{\text{Total charge}}{\text{Total capacity}}$$

$$= \frac{Q_1 + Q_2}{C_1 + C_2} = \frac{(1\times10^{-2}) + (5\times10^{-2})}{4\pi\varepsilon_0 10^{-2} + 4\pi\varepsilon_0(2\times10^{-2})}$$

$$= \frac{6\times10^{-2}}{4\pi\varepsilon_0(3\times10^{-2})}$$

Therefore final charge on smaller sphere $(C_1 V)$

$$= 4\pi\varepsilon_0 \times 10^{-2} \times \frac{6\times10^{-2}}{4\pi\varepsilon_0 \times 3\times10^{-2}} = 2\times10^{-2}\text{ C}.$$

64. **(b) :** Charge $(q) = 0.2$ C; Distance $(d) = 2$ m; Angle $\theta = 60°$ and work done $(W) = 4$ J.

Work done in moving the charge (W)

$= Fd\cos\theta = qEd\cos\theta$

or, $E = \dfrac{W}{qd\cos\theta} = \dfrac{4}{0.2\times2\times\cos 60°} = \dfrac{4}{0.4\times0.5}$

$= 20$ N/C.

65. **(c) :** For equilibrium of charge Q, the force of repulsion due to similar charges Q should be balanced by the force of attraction due to charge q and

$$\frac{1}{4\pi\varepsilon_0}\times\frac{Qq}{(r/2)^2} + \frac{1}{4\pi\varepsilon_0}\times\frac{Q^2}{r^2} = 0$$

or $\quad 4\times\dfrac{Q}{r^2}q = -\dfrac{Q^2}{r^2}$ or $4q = -Q$ or $q = -\dfrac{Q}{4}$.

66. **(b) :** To orient the dipole at any angle θ from its initial position, work has to be done on the dipole from $\theta = 0°$ to θ

$\therefore$ Potential energy $= pE(1 - \cos\theta)$

67. **(c) :** Electric lines of force start from the positive charge and end at the negative charge. Since the electric lines for both the charges are ending, therefore both q_1 and q_2 are negative charges.

68. **(c) :** Work done on carrying a charge from one place to another on an equipotential surface is zero.

69. **(a) :** Potential inside the sphere is the same as that on the surface *i.e.* 80 V.

70. **(c) :** Net force on each of the charge due to the other charges is zero. However, disturbance in any direction other than along the line on which the charges lie, will not make the charges return.

CHAPTER 13

Current Electricity

1. Two metal wires of identical dimensions are connected in series. If σ_1 and σ_2 are the conductivities of the metal wires respectively, the effective conductivity of the combination is

(a) $\dfrac{\sigma_1+\sigma_2}{\sigma_1\sigma_2}$ (b) $\dfrac{\sigma_1\sigma_2}{\sigma_1+\sigma_2}$

(c) $\dfrac{2\sigma_1\sigma_2}{\sigma_1+\sigma_2}$ (d) $\dfrac{\sigma_1+\sigma_2}{2\sigma_1\sigma_2}$

(AIPMT 2015)

2. A circuit contains an ammeter, a battery of 30 V and a resistance 40.8 ohm all connected in series. If the ammeter has a coil of resistance 480 ohm and a shunt of 20 ohm, the reading in the ammeter will be

(a) 2 A (b) 1 A

(c) 0.5 A (d) 0.25 A

(AIPMT 2015)

3. A potentiometer wire of length L and a resistance r are connected in series with a battery of e.m.f. E_0 and a resistance r_1. An unknown e.m.f. E is balanced at a length l of the potentiometer wire. The e.m.f. E will be given by

(a) $\dfrac{E_0 l}{L}$ (b) $\dfrac{LE_0 r}{(r+r_1)l}$

(c) $\dfrac{LE_0 r}{lr_1}$ (d) $\dfrac{E_0 r}{(r+r_1)}\cdot\dfrac{l}{L}$

(AIPMT 2015)

4. A, B and C are voltmeters of resistance R, $1.5R$ and $3R$ respectively as shown in the figure. When some potential difference is applied between X and Y, the voltmeter readings are V_A, V_B and V_C respectively. Then

(a) $V_A = V_B \neq V_C$ (b) $V_A \neq V_B \neq V_C$

(c) $V_A = V_B = V_C$ (d) $V_A \neq V_B = V_C$

(AIPMT 2015, Cancelled)

5. Across a metallic conductor of non-uniform cross section a constant potential difference is applied. The quantity which remains constant along the conductor is

(a) drift velocity (b) electric field

(c) current density (d) current

(AIPMT 2015, Cancelled)

6. A potentiometer wire has length 4 m and resistance 8 Ω. The resistance that must be connected in series with the wire and an accumulator of e.m.f. 2 V, so as to get a potential gradient 1 mV per cm on the wire is

(a) 44 Ω (b) 48 Ω

(c) 32 Ω (d) 40 Ω

(AIPMT 2015, Cancelled)

7. Two cities are 150 km apart. Electric power is sent from one city to another city through copper wires. The fall of potential per km is 8 volt and the average resistance per km is 0.5 Ω. The power loss in the wire is

(a) 19.2 W (b) 19.2 kW

(c) 19.2 J (d) 12.2 kW

(AIPMT 2014)

8. The resistances in the two arms of the meter bridge are 5 Ω and R Ω respectively. When the resistance R is shunted with an equal resistance, the new balance point is at $1.6l_1$. The resistance R is

(a) 10 Ω

(b) 15 Ω

(c) 20 Ω

(d) 25 Ω

(AIPMT 2014)

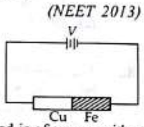
9. A potentiometer circuit has been set up for finding the internal resistance of a given cell. The main battery, used across the potentiometer wire, has an emf of 2.0 V and a negligible internal resistance. The potentiometer wire itself is 4 m long. When the resistance R, connected across the given cell, has values of
(i) infinity (ii) $9.5\ \Omega$
the balancing lengths on the potentiometer wire are found to be 3 m and 2.85 m, respectively. The value of internal resistance of the cell is
(a) $0.25\ \Omega$ (b) $0.95\ \Omega$
(c) $0.5\ \Omega$ (d) $0.75\ \Omega$
(AIPMT 2014)

10. The resistances of the four arms P, Q, R and S in a Wheatstone's bridge are 10 ohm, 30 ohm, 30 ohm and 90 ohm, respectively. The e.m.f. and internal resistance of the cell are 7 volt and 5 ohm respectively. If the galvanometer resistance is 50 ohm, the current drawn from the cell will be
(a) 0.1 A (b) 2.0 A
(c) 1.0 A (d) 0.2 A
(NEET 2013)

11. The internal resistance of a 2.1 V cell which gives a current of 0.2 A through a resistance of $10\ \Omega$ is
(a) $0.8\ \Omega$ (b) $1.0\ \Omega$
(c) $0.2\ \Omega$ (d) $0.5\ \Omega$
(NEET 2013)

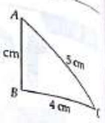
12. A wire of resistance $4\ \Omega$ is stretched to twice its original length. The resistance of stretched wire would be
(a) $8\ \Omega$ (b) $16\ \Omega$
(c) $2\ \Omega$ (d) $4\ \Omega$
(NEET 2013)

13. Two rods are joined end to end, as shown. Both have a cross-sectional area of $0.01\ cm^2$.



Each is 1 meter long. One rod is of copper with a resistivity of 1.7×10^{-6} ohm-centimeter, the other is of iron with a resistivity of 10^{-5} ohm-centimeter. How much voltage is required to produce a current of 1 ampere in the rods?
(a) 0.00145 V (b) 0.0145 V
(c) 1.7×10^{-6} V (d) 0.117 V
(Karnataka NEET 2013)

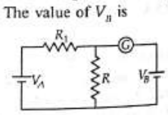
14. A 12 cm wire is given a shape of a right angled triangle ABC having sides 3 cm, 4 cm and 5 cm as shown in the figure.



The resistance between two ends (AB, BC, CA) of the respective sides are measured one by one by a multi-meter. The resistances will be in the ratio
(a) 9 : 16 : 25 (b) 27 : 32 : 35
(c) 21 : 24 : 25 (d) 3 : 4 : 5
(Karnataka NEET 2013)

15. Ten identical cells connected in series are needed to heat a wire of length one meter and radius 'r' by 10°C in time 't'. How many cells will be required to heat the wire of length two meter of the same radius by the same temperature in time 't'?
(a) 20 (b) 30
(c) 40 (d) 10
(Karnataka NEET 2013)

16. In the circuit shown the cells A and B have negligible resistances. For $V_A = 12$ V, $R_1 = 500\ \Omega$ and $R = 100\ \Omega$ the galvanometer (G) shows no deflection. The value of V_B is



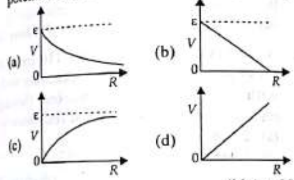
(a) 4 V (b) 2 V
(c) 12 V (d) 6 V
(Prelims 2012)

17. A ring is made of a wire having a resistance $R_0 = 12\ \Omega$. Find the points A and B, as shown in the figure, at which a current carrying conductor should be connected so that the resistance R of the sub circuit between these points is equal to $\frac{8}{3}\ \Omega$.

(a) $\frac{l_1}{l_2} = \frac{5}{8}$ (b) $\frac{l_1}{l_2} = \frac{1}{3}$
(c) $\frac{l_1}{l_2} = \frac{3}{8}$ (d) $\frac{l_1}{l_2} = \frac{1}{2}$
(Prelims 2012)

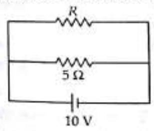
18. If voltage across a bulb rated 220 volt-100 watt drops by 2.5% of its rated value, the percentage of the rated value by which the power would decrease is
(a) 20% (b) 2.5%
(c) 5% (d) 10%
(Prelims 2012)

19. A cell having an emf ε and internal resistance r is connected across a variable external resistance R. As the resistance R is increased, the plot of potential difference V across R is given by



(Mains 2012)

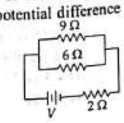
20. The power dissipated in the circuit shown in the figure is 30 watts. The value of R is



(a) $20\ \Omega$ (b) $15\ \Omega$
(c) $10\ \Omega$ (d) $30\ \Omega$
(Mains 2012)

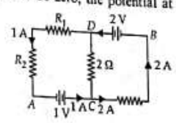
21. A current of 2 A flows through a $2\ \Omega$ resistor when connected across a battery. The same battery supplies a current of 0.5 A when connected across a $9\ \Omega$ resistor. The internal resistance of the battery is
(a) $0.5\ \Omega$ (b) $1/3\ \Omega$
(c) $1/4\ \Omega$ (d) $1\ \Omega$
(Prelims 2011)

22. If power dissipated in the $9\ \Omega$ resistor in the circuit shown is 36 watt, the potential difference across the $2\ \Omega$ resistor is



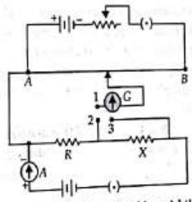
(a) 4 volt
(b) 8 volt
(c) 10 volt
(d) 2 volt
(Prelims 2011)

23. In the circuit shown in the figure, if the potential at point A is taken to be zero, the potential at point B is



(a) +1 V
(b) −1 V
(c) +2 V
(d) −2 V
(Mains 2011)

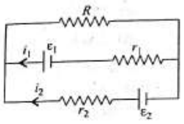
24. A potentiometer circuit is set up as shown. The potential gradient, across the potentiometer wire, is k volt/cm and the ammeter, present in the circuit, reads 1.0 A when two way key is switched off. The balance points, when the key between the terminals (i) 1 and 2 (ii) 1 and 3, is plugged in, are found to be at lengths l_1 cm and l_2 cm respectively. The magnitudes, of the resistors R and X, in ohms, are then, equal, respectively, to



(a) $k(l_2 - l_1)$ and kl_2 (b) kl_1 and $k(l_2 - l_1)$
(c) $k(l_2 - l_1)$ and kl_1 (d) kl_1 and kl_2
(Prelims 2010)

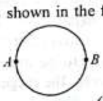
25. Consider the following two statements.
(A) Kirchhoff's junction law follows from the conservation of charge.
(B) Kirchhoff's loop law follows from the conservation of energy.
Which of the following is correct?
(a) Both (A) and (B) are wrong
(b) (A) is correct and (B) is wrong
(c) (A) is wrong and (B) is correct
(d) Both (A) and (B) are correct
(Prelims 2010)

26. See the electrical circuit shown in this figure. Which of the following equations is a correct equation for it?



(a) $\varepsilon_2 - i_2 r_2 - \varepsilon_1 - i_1 r_1 = 0$
(b) $-\varepsilon_2 - (i_1 + i_2) R + i_2 r_2 = 0$
(c) $\varepsilon_1 - (i_1 + i_2) R + i_1 r_1 = 0$
(d) $\varepsilon_1 - (i_1 + i_2) R - i_1 r_1 = 0$ *(Prelims 2009)*

27. A wire of resistance 12 ohms per meter is bent to form a complete circle of radius 10 cm. The resistance between its two diametrically opposite points, A and B as shown in the figure is

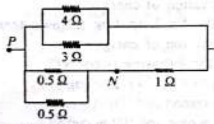


(a) $3\,\Omega$
(b) $6\pi\,\Omega$
(c) $6\,\Omega$
(d) $0.6\pi\,\Omega$ *(Prelims 2009)*

28. A student measures the terminal potential difference (V) of a cell (of emf ε and internal resistance r) as a function of the current (I) flowing through it. The slope, and intercept, of the graph between V and I, then, respectively, equal
(a) $-r$ and ε
(b) r and $-\varepsilon$
(c) $-\varepsilon$ and r
(d) ε and $-r$
(Prelims 2009)

29. The mean free path of electrons in a metal is 4×10^{-8} m. The electric field which can give on an average 2 eV energy to an electron in the metal will be in units V/m
(a) 5×10^{-11}
(b) 8×10^{-11}
(c) 5×10^{7}
(d) 8×10^{7}
(Prelims 2009)

30.



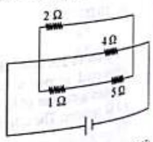
In the circuit shown, the current through the $4\,\Omega$ resistor is 1 amp when the points P and M are connected to a d.c. voltage source. The potential difference between the points M and N is
(a) 0.5 volt
(b) 3.2 volt
(c) 1.5 volt
(d) 1.0 volt
(Prelims 2008)

31. A wire of a certain material is stretched slowly by ten percent. Its new resistance and specific resistance become respectively
(a) both remain the same
(b) 1.1 times, 1.1 times
(c) 1.2 times, 1.1 times
(d) 1.21 times, same *(Prelims 2008)*

32. A cell can be balanced against 110 cm and 100 cm of potentiometer wire, respectively with and without being short circuited through a resistance of $10\,\Omega$. Its internal resistance is
(a) 2.0 ohm
(b) zero
(c) 1.0 ohm
(d) 0.5 ohm
(Prelims 2008)

33. An electric kettle takes 4 A current at 220 V. How much time will it take to boil 1 kg of water from temperature 20°C ? The temperature of boiling water is 100°C
(a) 12.6 min
(b) 4.2 min
(c) 6.3 min
(d) 8.4 min
(Prelims 2008)

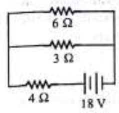
34. A current of 3 amp. flows through the $2\,\Omega$ resistor shown in the circuit. The power dissipated in the $5\,\Omega$ resistor is



(a) 1 watt
(b) 5 watt
(c) 4 watt
(d) 2 watt
(Prelims 2008)

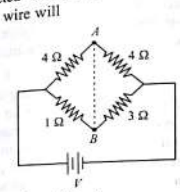
35. Three resistances P, Q, R each of $2\,\Omega$ and an unknown resistance S form the four arms of a Wheatstone bridge circuit. When a resistance of $6\,\Omega$ is connected in parallel to S the bridge gets balanced. What is the value of S?
(a) $3\,\Omega$
(b) $6\,\Omega$
(c) $1\,\Omega$
(d) $2\,\Omega$. *(2007)*

36. The total power dissipated in watt in the circuit shown here is



(a) 40
(b) 54
(c) 4
(d) 16. *(2007)*

37. In the circuit shown, if a conducting wire is connected between points A and B, the current in this wire will

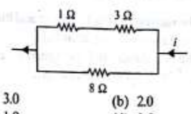


(a) flow from B to A
(b) flow from A to B
(c) flow in the direction which will be decided by the value of V
(d) be zero. *(2006)*

38. Kirchhoff's first and second laws of electrical circuits are consequences of
(a) conservation of energy and electric charge respectively
(b) conservation of energy
(c) conservation of electric charge and energy respectively
(d) conservation of electric charge. *(2006)*

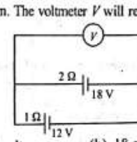
39. Two cells, having the same e.m.f. are connected in series through an external resistance R. Cells have internal resistances r_1 and r_2 ($r_1 > r_2$) respectively. When the circuit is closed, the potential difference across the first cell is zero. The value of R is
(a) $r_1 + r_2$
(b) $r_1 - r_2$
(c) $\frac{r_1 + r_2}{2}$
(d) $\frac{r_1 - r_2}{2}$ *(2006)*

40. Power dissipated across the $8\,\Omega$ resistor in the circuit shown here is 2 watt. The power dissipated in watt units across the $3\,\Omega$ resistor is



(a) 3.0
(b) 2.0
(c) 1.0
(d) 0.5 *(2006)*

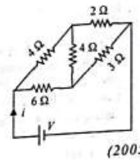
41. Two batteries, one of emf 18 volts and internal resistance $2\,\Omega$ and the other of emf 12 volts and internal resistance $1\,\Omega$, are connected as shown. The voltmeter V will record a reading of



(a) 30 volt
(b) 18 volt
(c) 15 volt
(d) 14 volt. *(2005)*

42. When a wire of uniform cross-section a, length l and resistance R is bent into a complete circle, resistance between any two of diametrically opposite points will be
(a) $R/4$
(b) $4R$
(c) $R/8$
(d) $R/2$. *(2005)*

43. For the network shown in the figure the value of the current i is



(a) $\frac{9V}{35}$
(b) $\frac{18V}{5}$
(c) $\frac{5V}{9}$
(d) $\frac{5V}{18}$ *(2005)*

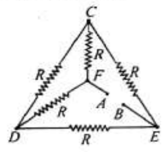
44. A 5-ampere fuse wire can withstand a maximum power of 1 watt in the circuit. The resistance of the fuse wire is
(a) 0.04 ohm
(b) 0.2 ohm
(c) 5 ohm
(d) 0.4 ohm. *(2005)*

45. The electric resistance of a certain wire of iron is R. If its length and radius are both doubled, then
(a) The resistance will be doubled and the specific resistance will be halved.
(b) The resistance will be halved and the specific resistance will remain unchanged.

(c) The resistance will be halved and the specific resistance will be doubled.
(d) The resistance and the specific resistance, will both remain unchanged. *(2004)*

46. Resistance n, each of r ohm, when connected in parallel give an equivalent resistance of R ohm. If these resistances were connected in series, the combination would have a resistance in ohms, equal to
(a) n^2R (b) R/n^2
(c) R/n (d) nR *(2004)*

47. Five equal resistances each of resistance R are connected as shown in the figure. A battery of V volts is connected between A and B. The current flowing in $AFCEB$ will be



(a) $\frac{3V}{R}$ (b) $\frac{V}{R}$
(c) $\frac{V}{2R}$ (d) $\frac{2V}{R}$ *(2004)*

48. A 6 volt battery is connected to the terminals of a three metre long wire of uniform thickness and resistance of 100 ohm. The difference of potential between two points on the wire separated by a distance of 50 cm will be
(a) 2 volt (b) 3 volt
(c) 1 volt (d) 1.5 volt *(2004)*

49. When three identical bulbs of 60 watt, 200 volt rating are connected in series to a 200 volt supply, the power drawn by them will be
(a) 60 watt (b) 180 watt
(c) 10 watt (d) 20 watt *(2004)*

50. In India electricity is supplied for domestic use at 220 V. It is supplied at 110 V in USA. If the resistance of a 60 W bulb for use in India is R, the resistance of a 60 W bulb for use in USA will be
(a) R (b) $2R$
(c) $R/4$ (d) $R/2$ *(2004)*

51. In a Wheatstone's bridge all the four arms have equal resistance R. If the resistance of the galvanometer arm is also R, the equivalent resistance of the combination as seen by the battery is
(a) $R/4$ (b) $R/2$
(c) R (d) $2R$ *(2003)*

52. Two 220 volt, 100 watt bulbs are connected first in series and then in parallel. Each time the combination is connected to a 220 volt a.c. supply line. The power drawn by the combination in each case respectively will be
(a) 50 watt, 100 watt (b) 100 watt, 50 watt
(c) 200 watt, 150 watt (d) 50 watt, 200 watt *(2003)*

53. An electric kettle has two heating coils. When one of the coils is connected to an a.c. source, the water in the kettle boils in 10 minutes. When the other coil is used the water boils in 40 minutes. If both the coils are connected in parallel, the time taken by the same quantity of water to boil will be
(a) 8 minutes (b) 4 minutes
(c) 25 minutes (d) 15 minutes *(2003)*

54. Fuse wire is a wire of
(a) high resistance and high melting point
(b) high resistance and low melting point
(c) low resistance and low melting point
(d) low resistance and high melting point *(2003)*

55. For a cell terminal potential difference is 2.2 V when circuit is open and reduces to 1.8 V when cell is connected to a resistance of $R = 5\,\Omega$. Determine internal resistance of cell (r)
(a) $\frac{10}{9}\,\Omega$ (b) $\frac{9}{10}\,\Omega$
(c) $\frac{11}{9}\,\Omega$ (d) $\frac{5}{9}\,\Omega$ *(2002)*

56. Specific resistance of a conductor increases with
(a) increase in temperature
(b) increase in cross-section area
(c) increase in cross-section and decrease in length
(d) decrease in cross-section area. *(2002)*

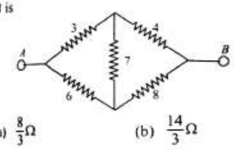
57. Copper and silicon is cooled from 300 K to 60 K, the specific resistance

(a) decrease in copper but increase in silicon
(b) increase in copper but decrease in silicon
(c) increase in both
(d) decrease in both. *(2001)*

58. The resistance of each arm of the Wheatstone's bridge is 10 ohm. A resistance of 10 ohm is connected in series with a galvanometer then the equivalent resistance across the battery will be
(a) 10 ohm (b) 15 ohm
(c) 20 ohm (d) 40 ohm. *(2001)*

59. If specific resistance of a potentiometer wire is $10^{-7}\,\Omega$m and current flow through it is 0.1 amp., cross-sectional area of wire is 10^{-6} m^2 then potential gradient will be
(a) 10^{-2} volt/m (b) 10^{-4} volt/m
(c) 10^{-6} volt/m (d) 10^{-8} volt/m. *(2001)*

60. The net resistance of the circuit between A and B is



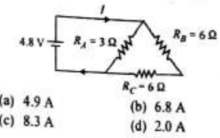
(a) $\frac{8}{3}\Omega$ (b) $\frac{14}{3}\Omega$
(c) $\frac{16}{3}\Omega$ (d) $\frac{22}{3}\Omega$ *(2000)*

61. A car battery of emf 12 V and internal resistance $5 \times 10^{-2}\,\Omega$, receives a current of 60 amp, from external source, then terminal potential difference of battery is
(a) 12 V (b) 9 V
(c) 15 V (d) 20 V. *(2000)*

62. Two bulbs of (40 W, 200 V), and (100 W, 200 V). Then correct relation for their resistances
(a) $R_{40} < R_{100}$
(b) $R_{40} > R_{100}$
(c) $R_{40} = R_{100}$
(d) no relation can be predicted. *(2000)*

63. The potentiometer is best for measuring voltage, as
(a) it has a sensitive galvanometer and gives null deflection
(b) it has wire of high resistance
(c) it measures p.d. in closed circuit
(d) it measures p.d in open circuit. *(2000)*

64. The current in the given circuit is



(a) 4.9 A (b) 6.8 A
(c) 8.3 A (d) 2.0 A *(1999)*

65. The internal resistance of a cell of e.m.f. 2 V is 0.1 Ω. It is connected to a resistance of 3.9 Ω. The voltage across the cell will be
(a) 1.95 V (b) 1.9 V
(c) 0.5 V (d) 2 V *(1999)*

66. In a meter bridge, the balancing length from the left end (standard resistance of one ohm is in the right gap) is found to be 20 cm. The value of the unknown resistance is
(a) 0.8 Ω (b) 0.5 Ω
(c) 0.4 Ω (d) 0.25 Ω *(1999)*

67. A potentiometer consists of a wire of length 4 m and resistance 10 Ω. It is connected to a cell of e.m.f. 2 V. The potential difference per unit length of the wire will be
(a) 5 V/m (b) 2 V/m
(c) 0.5 V/m (d) 10 V/m *(1999)*

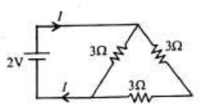
68. The resistance of a discharge tube is
(a) non-ohmic (b) ohmic
(c) zero (d) both (b) and (c) *(1999)*

69. Three equal resistors connected in series across a source of e.m.f. together dissipate 10 watt of power. What will be the power dissipated in watt if the same resistors are connected in parallel across the same source of e.m.f.?
(a) 30 (b) $\frac{10}{3}$
(c) 10 (d) 90 *(1998)*

70. A 5°C rise in temperature is observed in a conductor by passing a current. When the current is doubled the rise in temperature will be approximately
(a) 20°C (b) 16°C
(c) 10°C (d) 12°C *(1998)*

71. Three copper wires of lengths and cross-sectional areas are (l, A), $(2l, A/2)$ and $(l/2, 2A)$. Resistance is minimum in
(a) wire of cross-sectional area $2A$
(b) wire of cross-sectional area $\frac{A}{2}$
(c) wire of cross-sectional area A
(d) same in all three cases. *(1997)*

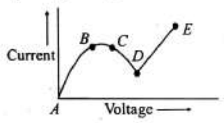
72. The current in the following circuit is



(a) 2/3 A (b) 1 A
(c) 1/8 A (d) 2/9 A. *(1997)*

73. Kirchhoff's first law, *i.e.* $\Sigma i = 0$ at a junction, deals with the conservation of
(a) momentum (b) angular momentum
(c) charge (d) energy. *(1997, 92)*

74. From the graph between current (I) and voltage (V) is shown below. Identify the portion corresponding to negative resistance



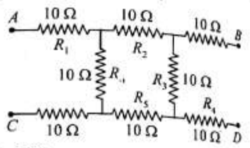
(a) CD (b) DE
(c) AB (d) BC. *(1997)*

75. A (100 W, 200 V) bulb is connected to a 160 volts supply. The power consumption would be
(a) 100 W (b) 125 W
(c) 64 W (d) 80 W. *(1997)*

76. One kilowatt hour is equal to
(a) 36×10^{-5} J (b) 36×10^{-4} J
(c) 36×10^{5} J (d) 36×10^{3} J. *(1997)*

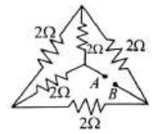
77. If two bulbs, whose resistances are in the ratio of 1 : 2 are connected in series, the power dissipated in them has the ratio of
(a) 2 : 1 (b) 1 : 4
(c) 1 : 1 (d) 1 : 2. *(1997)*

78. What will be the equivalent resistance between the two points A and D?



(a) 30 Ω (b) 40 Ω
(c) 10 Ω (d) 10 Ω. *(1996)*

79. In the network shown in the figure, each of the resistance is equal to 2 Ω. The resistance between the points A and B is



(a) 3 Ω (b) 4 Ω
(c) 1 Ω (d) 2 Ω. *(1995)*

80. Two wires of the same metal have same length but their cross-sections are in the ratio 3 : 1. They are joined in series. The resistance of thicker wire is 10 Ω. The total resistance of the combination will be
(a) 40 Ω (b) 100 Ω
(c) (5/2) Ω (d) (40/3) Ω. *(1995)*

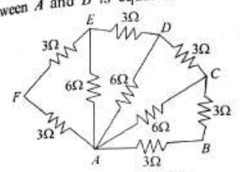
81. In good conductors of electricity, the type of bonding that exists is
(a) metallic (b) vander Waals
(c) ionic (d) covalent. *(1995)*

82. A heating coil is labelled 100 W, 220 V. The coil is cut in half and the two pieces are joined in parallel to the same source. The energy now liberated per second is
(a) 200 W (b) 400 W
(c) 25 W (d) 50 W *(1995)*

83. A 4 μF capacitor is charged to 400 V. If its plates are joined through a resistance of 2 kΩ, then heat produced in the resistance is
(a) 0.64 J (b) 1.28 J
(c) 0.16 J (d) 0.32 J. *(1995)*

84. A wire 50 cm long and 1 mm² in cross-section carries a current of 4 A when connected to a 2 V battery. The resistivity of the wire is
(a) 4×10^{-6} Ω·m (b) 1×10^{-6} Ω·m
(c) 2×10^{-7} Ω·m (d) 5×10^{-7} Ω·m. *(1994)*

85. Six resistors of 3 Ω each are connected along the sides of a hexagon and three resistors of 6 Ω each are connected along AC, AD and AE as shown in the figure. The equivalent resistance between A and B is equal to



(a) 2 Ω (b) 6 Ω
(c) 3 Ω (d) 9 Ω. *(1994)*

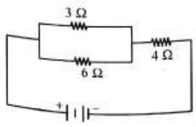
86. A flow of 10^7 electrons per second in a conducting wire constitutes a current of
(a) 1.6×10^{-12} A (b) 1.6×10^{26} A
(c) 1.6×10^{-26} A (d) 1.6×10^{12} A. *(1994)*

87. Identify the set in which all the three materials are good conductors of electricity
(a) Cu, Hg and NaCl (b) Cu, Ge and Hg
(c) Cu, Ag and Au (d) Cu, Si and diamond. *(1994)*

88. An electric bulb is rated 60 W, 220 V. The resistance of its filament is
(a) 870 Ω (b) 780 Ω
(c) 708 Ω (d) 807 Ω. *(1994)*

89. Three resistances each of 4 Ω are connected to form a triangle. The resistance between any two terminals is
(a) 12 Ω (b) 2 Ω
(c) 6 Ω (d) 8/3 Ω *(1993)*

90. Current through 3 Ω resistor is 0.8 ampere, then potential drop through 4 Ω resistor is

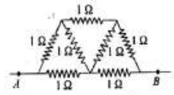


(a) 9.6 V (b) 2.6 V
(c) 4.8 V (d) 1.2 V *(1993)*

91. A battery of e.m.f 10 V and internal resistance 0.5 Ω is connected across a variable resistance R. The value of R for which the power delivered in it is maximum is given by
(a) 0.5 Ω (b) 1.0 Ω
(c) 2.0 Ω (d) 0.25 Ω *(1992)*

92. The velocity of charge carriers of current (about 1 ampere) in a metal under normal conditions is of the order of
(a) a fraction of mm/sec
(b) velocity of light
(c) several thousand metres/second
(d) a few hundred metres per second *(1991)*

93. In the network shown in figure each resistance is 1 Ω. The effective resistance between A and B is



(a) $\frac{4}{3}$ Ω (b) $\frac{3}{2}$ Ω
(c) 7 Ω (d) $\frac{8}{7}$ Ω *(1990)*

94. Two identical batteries each of e.m.f 2 V and internal resistance 1 Ω are available to produce heat in an external resitance by passing a current through it. The maximum power that can be developed across R using these batteries is
(a) 3.2 W (b) 2.0 W
(c) 1.28 W (d) $\frac{8}{9}$ W *(1990)*

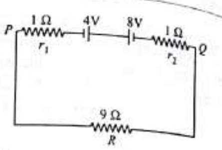
95. You are given several identical resistances each of value $R = 10$ Ω and each capable of carrying a maximum current of one ampere. It is required to make a suitable combination of these resistances of 5 Ω which can carry a current of 4 ampere. The minimum number of resistances of the type R that will be required for this job is
(a) 4 (b) 10
(c) 8 (d) 20 *(1990)*

96. A current of 2 A, passing through a conductor produces 80 J of heat in 10 seconds. The resistance of the conductor in ohm is
(a) 0.5 (b) 2
(c) 4 (d) 20 *(1989)*

97. 40 electric bulbs are connected in series across a 220 V supply. After one bulb is fused the remaining 39 are connected again in series across the same supply. The illumination will be
(a) more with 40 bulbs than with 39
(b) more with 39 bulbs than with 40
(c) equal in both the cases
(d) in the ratio $40^2 : 39^2$ *(1989)*

98. n equal resistors are first connected in series and then connected in parallel. What is the ratio of the maximum to the minimum resistance?
(a) n (b) $1/n^2$
(c) n^2 (d) $1/n$ *(1989)*

99. Two batteries of emf 4 V and 8 V with internal resistance 1 Ω and 2 Ω are connected in a circuit with resistance of 9 Ω as shown in figure. The current and potential difference between the points P and Q are



(a) $\frac{1}{3}$ A and 3 V (b) $\frac{1}{6}$ A and 4 V
(c) $\frac{1}{9}$ A and 9 V (d) $\frac{1}{12}$ A and 12 V *(1988)*

100. The masses of the wires of copper is in the ratio of 1 : 3 : 5 and their lengths are in the ratio of 5 : 3 : 1. The ratio of their electrical resistance is
(a) 1 : 3 : 5 (b) 5 : 3 : 1
(c) 1 : 25 : 125 (d) 125 : 15 : 1 *(1988)*

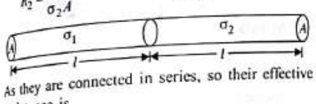
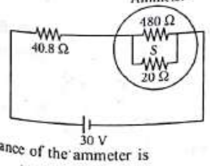
EXPLANATIONS

1. (c): As both metal wires are of identical dimensions, so their length and area of cross-section will be same. Let them be l and A respectively. Then
The resistance of the first wire is
$$R_1 = \frac{l}{\sigma_1 A} \quad \text{... (i)}$$
and that of the second wire is
$$R_2 = \frac{l}{\sigma_2 A} \quad \text{... (ii)}$$



As they are connected in series, so their effective resistance is
$$R_s = R_1 + R_2$$
$$= \frac{l}{\sigma_1 A} + \frac{l}{\sigma_2 A} \quad \text{(using (i) and (ii))}$$
$$= \frac{l}{A}\left(\frac{1}{\sigma_1} + \frac{1}{\sigma_2}\right) \quad \text{... (iii)}$$
If σ_{eff} is the effective conductivity of the combination, then
$$R_s = \frac{2l}{\sigma_{eff} A} \quad \text{... (iv)}$$
Equating eqns. (iii) and (iv), we get
$$\frac{2l}{\sigma_{eff} A} = \frac{l}{A}\left(\frac{1}{\sigma_1} + \frac{1}{\sigma_2}\right)$$
$$\frac{2}{\sigma_{eff}} = \frac{\sigma_2 + \sigma_1}{\sigma_1 \sigma_2} \quad \sigma_{eff} = \frac{2\sigma_1\sigma_2}{\sigma_1 + \sigma_2}$$

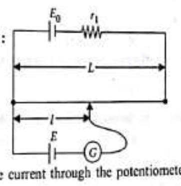
2. (c): The circuit is shown in the figure.



Resistance of the ammeter is
$$R_A = \frac{(480\ \Omega)(20\ \Omega)}{(480\ \Omega + 20\ \Omega)} = 19.2\ \Omega$$
(As 480 Ω and 20 Ω are in parallel)

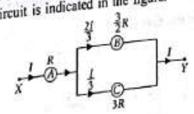
As ammeter is in series with 40.8 Ω,
∴ Total resistance of the circuit is
$$R = 40.8\ \Omega + R_A = 40.8\ \Omega + 19.2\ \Omega = 60\ \Omega$$
By Ohm's law,
Current in the circuit is
$$I = \frac{V}{R} = \frac{30\ \text{V}}{60\ \Omega} = \frac{1}{2}\ \text{A} = 0.5\ \text{A}$$
Thus the reading in the ammeter will be 0.5 A.

3. (d) :



The current through the potentiometer wire is
$$I = \frac{E_0}{(r + r_1)}$$
and the potential difference across the wire is
$$V = Ir = \frac{E_0 r}{(r + r_1)}$$
The potential gradient along the potentiometer wire is
$$k = \frac{V}{L} = \frac{E_0 r}{(r + r_1)L}$$
As the unknown e.m.f. E is balanced against length l of the potentiometer wire,
$$\therefore\ E = kl = \frac{E_0 r}{(r + r_1)}\frac{l}{L}$$

4. (c) : The current flowing in the different branches of circuit is indicated in the figure.



$$V_A = IR$$
$$V_B = \frac{2I}{3} \times \frac{3}{2}R = IR$$
$$V_C = \frac{I}{3} \times 3R = IR$$
Thus, $V_A = V_B = V_C$

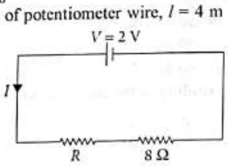
Scanned by CamScanner

5. (d) : The area of cross section of conductor is non uniform so current density will be different but the flow of electrons will be uniform so current will be constant.

6. (c) : Required potential gradient = 1 mV cm^{-1}

$$= \frac{1}{10} \text{ V m}^{-1}$$

Length of potentiometer wire, l = 4 m



So potential difference across potentiometer wire

$$= \frac{1}{10} \times 4 = 0.4 \text{ V} \quad \text{...(i)}$$

In the circuit, potential difference across 8 Ω

$$= I \times 8 = \frac{2}{8+R} \times 8 \quad \text{...(ii)}$$

Using equation (i) and (ii), we get

$$0.4 = \frac{2}{8+R} \times 8$$

$$\frac{4}{10} = \frac{16}{8+R}, 8 + R = 40$$

$$\therefore \quad R = 32 \, \Omega$$

7. (b) : Here,

Distance between two cities = 150 km

Resistance of the wire, R = (0.5 Ω km^{-1})(150 km) = 75 Ω

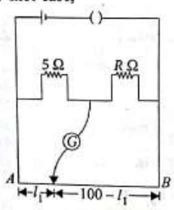
Voltage drop across the wire,

$$V = (8 \text{ V km}^{-1})(150 \text{ km}) = 1200 \text{ V}$$

Power loss in the wire is

$$P = \frac{V^2}{R} = \frac{(1200 \text{ V})^2}{75 \, \Omega} = 19200 \text{ W} = 19.2 \text{ kW}$$

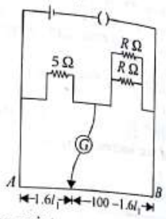
8. (b) : In the first case,



At balance point

$$\frac{5}{R} = \frac{l_1}{100 - l_1}$$

In the second case,



At balance point

$$\frac{5}{(R/2)} = \frac{1.6 l_1}{100 - 1.6 l_1} \quad \text{...(ii)}$$

Divide eqn. (i) by eqn. (ii), we get

$$\frac{1}{2} = \frac{100 - 1.6 l_1}{1.6(100 - l_1)}$$

$$160 - 1.6 l_1 = 200 - 3.2 l_1$$

$$1.6 l_1 = 40 \quad \text{or} \quad l_1 = \frac{40}{1.6} = 25 \text{ cm}$$

Substituting this value in eqn. (i), we get

$$\frac{5}{R} = \frac{25}{75}$$

$$R = \frac{375}{25} \, \Omega = 15 \, \Omega$$

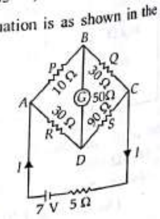
9. (c) : The internal resistance of the cell is

$$r = \left(\frac{l_1}{l_2} - 1\right) R$$

Here, l_1 = 3 m, l_2 = 2.85 m, R = 9.5 Ω

$$\therefore \quad r = \left(\frac{3}{2.85} - 1\right)(9.5 \, \Omega) = \frac{0.15}{2.85} \times 9.5 \, \Omega = 0.5 \, \Omega$$

10. (d) : The situation is as shown in the figure.



For a balanced Wheatstone's bridge

$$\frac{P}{Q} = \frac{R}{S}$$

$$\therefore \quad \frac{10 \, \Omega}{30 \, \Omega} = \frac{30 \, \Omega}{90 \, \Omega} \text{ or } \frac{1}{3} = \frac{1}{3}$$

It is a balanced Wheatstone's bridge. Hence no current flows in the galvanometer arm. Hence, resistance 50 Ω becomes ineffective.

∴ The equivalent resistance of the circuit is

$$R_{eq} = 5 \, \Omega + \frac{(10 \, \Omega + 30 \, \Omega)(30 \, \Omega + 90 \, \Omega)}{(10 \, \Omega + 30 \, \Omega) + (30 \, \Omega + 90 \, \Omega)}$$

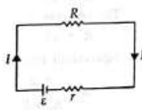
$$= 5 \, \Omega + \frac{(40 \, \Omega)(120 \, \Omega)}{40 \, \Omega + 120 \, \Omega}$$

$$= 5 \, \Omega + 30 \, \Omega = 35 \, \Omega$$

Current drawn from the cell is

$$I = \frac{7 \text{ V}}{35 \, \Omega} = \frac{1}{5} \text{ A} = 0.2 \text{ A}$$

11. (d) : $I = \frac{\varepsilon}{R + r}$



or $IR + Ir = \varepsilon$

Here, R = 10 Ω, r = ?,

ε = 2.1 V, I = 0.2 A

$$\therefore \quad 0.2 \times 10 + 0.2 \times r = 2.1$$

$$2 + 0.2r = 2.1$$

$$0.2r = 0.1 \text{ or } r = \frac{1}{2} = 0.5 \, \Omega$$

12. (b) : Resistance of a wire,

$$R = \rho \frac{l}{A} = 4 \, \Omega \quad \text{...(i)}$$

When wire is stretched twice, its new length be l'. Then

$$l' = 2l$$

On stretching volume of the wire remains constant.

∴ $lA = l'A'$ where A' is the new cross-sectional area

or $A' = \frac{l}{l'} A = \frac{l}{2l} A = \frac{A}{2}$

∴ Resistance of the stretched wire is

$$R' = \rho \frac{l'}{A'} = \rho \frac{2l}{(A/2)} = 4\rho \frac{l}{A}$$

$$= 4(4 \, \Omega) = 16 \, \Omega \quad \text{(Using (i))}$$

13. (d) : Here,

Length of each rod, l = 1 m

Area of cross-section of each rod,

A = 0.01 cm^2 = 0.01 × 10^{-4} m^2

Resistivity of copper rod,

ρ_{cu} = 1.7 × 10^{-6} Ω cm

= 1.7 × 10^{-6} × 10^{-2} Ω m = 1.7 × 10^{-8} Ω m

Resistivity of iron rod,

ρ_{Fe} = 10^{-5} Ω cm

= 10^{-5} × 10^{-2} Ω m = 10^{-7} Ω m

∴ Resistance of copper rod,

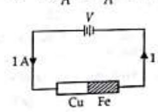
$$R_{Cu} = \rho_{Cu} \frac{l}{A}$$

and resistance of iron rod,

$$R_{Fe} = \rho_{Fe} \frac{l}{A}$$

As copper and iron rods are connected in series, therefore equivalent resistance is

$$R = R_{Cu} + R_{Fe} = \rho_{Cu} \frac{l}{A} + \rho_{Fe} \frac{l}{A} = (\rho_{Cu} + \rho_{Fe}) \frac{l}{A}$$



Voltage required to produce 1 A current in the rods is

$$V = IR = (1)(R_{Cu} + R_{Fe})$$

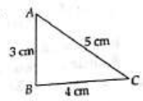
$$= (\rho_{Cu} + \rho_{Fe})\left(\frac{l}{A}\right)$$

$$= (1.7 \times 10^{-8} + 10^{-7})\left(\frac{1}{0.01 \times 10^{-4}}\right) \text{V}$$

$$= 10^{-7}(0.17 + 1)(10^6) \text{ V} = 1.17 \times 10^{-1} \text{ V} = 0.117 \text{ V}$$

14. (b) : Let ρ and A be resistivity and area of cross-section of the wire respectively.

The wire is bent in the form of right triangle as shown in adjacent figure.



Resistance of side AB is $R_1 = \frac{3\rho}{A}$

Resistance of side BC is $R_2 = \frac{4\rho}{A}$

Resistance of side AC is $R_3 = \frac{5\rho}{A}$

$\therefore$ The resistance between the ends A and B is

$$R_{AB} = \frac{R_1(R_2+R_3)}{R_1+R_2+R_3} = \frac{\frac{3\rho}{A}\left(\frac{4\rho}{A}+\frac{5\rho}{A}\right)}{\frac{3\rho}{A}+\left(\frac{4\rho}{A}+\frac{5\rho}{A}\right)} = \frac{27}{12}\frac{\rho}{A}$$

The resistance between the ends B and C is

$$R_{BC} = \frac{R_2(R_1+R_3)}{R_2+R_1+R_3} = \frac{\frac{4\rho}{A}\left(\frac{3\rho}{A}+\frac{5\rho}{A}\right)}{\frac{4\rho}{A}+\frac{3\rho}{A}+\frac{5\rho}{A}} = \frac{32}{12}\frac{\rho}{A}$$

The resistance between the ends A and C is

$$R_{AC} = \frac{R_3(R_1+R_2)}{R_3+R_1+R_2}$$

$$= \frac{\frac{5\rho}{A}\left(\frac{3\rho}{A}+\frac{4\rho}{A}\right)}{\frac{5\rho}{A}+\frac{3\rho}{A}+\frac{4\rho}{A}} = \frac{35}{12}\frac{\rho}{A}$$

$$\therefore \quad R_{AB}:R_{BC}:R_{AC} = \frac{27}{12}:\frac{32}{12}:\frac{35}{12} = 27:32:35$$

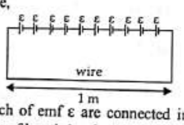
15. **(a)** : Let ρ be resistivity of the material of the wire and r be radius of the wire.

Therefore, resistance of 1 m wire is

$$R = \frac{\rho(1)}{\pi r^2} = \frac{\rho}{\pi r^2} \qquad \left(\because R = \frac{\rho l}{A}\right)$$

Let ε be emf of each cell.

In first case,



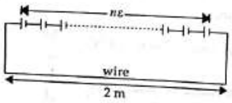
10 cells each of emf ε are connected in series to heat the wire of length 1 m by $\Delta T(= 10°C)$ in time t.

$$\therefore \quad \frac{(10\varepsilon)^2}{R}t = ms\Delta T \qquad \text{...(i)}$$

In second case,

Resistance of same wire of length 2 m is

$$R' = \frac{\rho(2)}{\pi r^2} = \frac{2\rho}{\pi r^2} = 2R$$



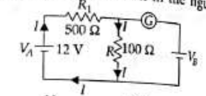
Let n cells each of emf ε are connected in series to heat the same wire of length 2 m, by the same temperature $\Delta T(= 10°C)$ in the same time t.

$$\therefore \quad \frac{(n\varepsilon)^2 t}{2R} = (2m)s\Delta T \qquad \text{...(ii)}$$

Divide (ii) by (i), we get

$$\frac{n^2}{200} = 2 \Rightarrow n^2 = 400 \quad \therefore \; n = 20$$

16. **(b)** : Since the galvanometer shows no deflection so current will flow as shown in the figure.



$$\text{Current, } I = \frac{V_A}{R_1+R} = \frac{12\text{ V}}{(500+100)\,\Omega} = \frac{12}{600}\text{ A}$$

$$V_B = IR = \left(\frac{12}{600}\text{ A}\right)(100\,\Omega) = 2\text{ V}$$

17. **(d)** : Let x be resistance per unit length of the wire. Then,

The resistance of the upper portion is

$R_1 = xl_1$

The resistance of the lower portion is

$R_2 = xl_2$

Equivalent resistance between A and B is

$$R = \frac{R_1R_2}{R_1+R_2} = \frac{(xl_1)(xl_2)}{xl_1+xl_2}$$

$$\frac{8}{3} = \frac{xl_1l_2}{l_1+l_2} \text{ or } \frac{8}{3} = \frac{xl_1l_2}{l_2\left(\frac{l_1}{l_2}+1\right)}$$

$$\text{or} \quad \frac{8}{3} = \frac{xl_1}{\left(\frac{l_1}{l_2}+1\right)} \qquad \text{...(i)}$$

Also $R_e = xl_1 + xl_2$

$12 = x(l_1+l_2)$

$$12 = xl_2\left(\frac{l_1}{l_2}+1\right) \qquad \text{...(ii)}$$

Divide (i) by (ii), we get

$$\frac{\frac{8}{3}}{12} = \frac{\frac{xl_1}{\left(\frac{l_1}{l_2}+1\right)}}{xl_2\left(\frac{l_1}{l_2}+1\right)} \text{ or } \frac{8}{36} = \frac{l_1}{l_2\left(\frac{l_1}{l_2}+1\right)^2}$$

$$\left(\frac{l_1}{l_2}+1\right)^2\frac{8}{36} = \frac{l_1}{l_2} \text{ or } \left(\frac{l_1}{l_2}+1\right)^2\frac{2}{9} = \frac{l_1}{l_2}$$

Let $y = \frac{l_1}{l_2}$

$\therefore \; 2(y+1)^2 = 9y$ or $2y^2+2+4y = 9y$

or $2y^2 - 5y + 2 = 0$

Solving this quadratic equation, we get

$$y = \frac{1}{2} \text{ or } 2 \; \therefore \; \frac{l_1}{l_2} = \frac{1}{2}$$

18. **(c)** : Power, $P = \frac{V^2}{R}$

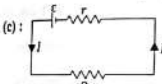
As the resistance of the bulb is constant

$$\therefore \quad \frac{\Delta P}{P} = \frac{2\Delta V}{V}$$

$$\%\text{ decrease in power} = \frac{\Delta P}{P}\times 100 = \frac{2\Delta V}{V}\times 100$$

$$= 2 \times 2.5\% = 5\%$$

19. **(c)** :



Current in the circuit,

$$I = \frac{\varepsilon}{R+r}$$

Potential difference across R,

$$V = IR = \left(\frac{\varepsilon}{R+r}\right)R$$

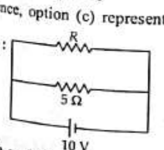
$$V = \frac{\varepsilon}{1+\frac{r}{R}}$$

When $R = 0$, $V = 0$

$R = \infty$, $V = \varepsilon$

Hence, option (c) represents the correct graph.

20. **(c)** :



The equivalent resistance of the given circuit is

$$R_{eq} = \frac{5R}{5+R}$$

Power dissipated in the given circuit is

$$P = \frac{V^2}{R_{eq}}$$

$$30 = \frac{(10)^2}{\left(\frac{5R}{5+R}\right)}$$

$150R = 100(5+R)$

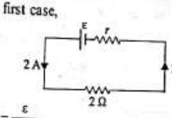
$150R = 500 + 100R$

$50R = 500$

$$R = \frac{500}{50} = 10\,\Omega$$

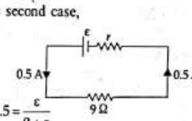
21. **(b)** : Let ε be the emf and r be internal resistance of the battery.

In the first case,



$$2 = \frac{\varepsilon}{2+r} \qquad \text{...(i)}$$

In the second case,



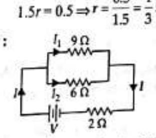
$$0.5 = \frac{\varepsilon}{9+r} \qquad \text{...(ii)}$$

Divide (i) by (ii), we get

$$\frac{2}{0.5} = \frac{9+r}{2+r} \Rightarrow 4 + 2r = 4.5 + 0.5r$$

$$1.5r = 0.5 \Rightarrow r = \frac{0.5}{1.5} = \frac{1}{3}\,\Omega$$

22. **(c)** :



Current flows through the 9 Ω resistor is

$$I_1^2 = \frac{36}{9} = 4 \qquad (\text{As } P = I^2R)$$

$I_1 = 2$ A

As the resistors 9 Ω and 6 Ω are connected in parallel, therefore potential difference across them is same.

$\therefore \; 9I_1 = 6I_2$

$$I_2 = \frac{9\times 2}{6} = 3\text{ A}$$

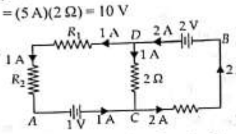
Current drawn from the battery is

$I = I_1 + I_2 = (2+3)\,A = 5\,A$

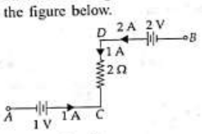
The potential difference across the $2\,\Omega$ resistor is

$= (5\,A)(2\,\Omega) = 10\,V$

23. (a) :



Applying Kirchhoff voltage law in the circuit as shown in the figure below.

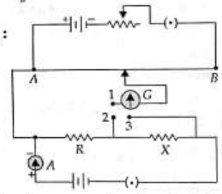


$\therefore\quad V_A + 1 + 2(1) - 2 = V_B$

$0 + 1 = V_B \qquad (\because V_A = 0\,V \text{ (Given)})$

$V_B = +1\,V$

24. (b) :



When the two way key is switched off, then
The current flowing in the resistors R and X is

$I = 1\,A$ ...(i)

When the key between the terminals 1 and 2 is plugged in, then

Potential difference across $R = IR = kl_1$ ...(ii)

where k is the potential gradient across the potentiometer wire

When the key between the terminals 1 and 3 is plugged in, then

Potential difference across $(R+X) = I(R+X) = kl_2$ ...(iii)

From equation (ii), we get

$R = \frac{kl_1}{I} = \frac{kl_1}{1} = kl_1\,\Omega$ ...(iv)

From equation (iii), we get

$R + X = \frac{kl_2}{I} = \frac{kl_2}{1} = kl_2\,\Omega$ (Using (i))

$X = kl_2 - R$

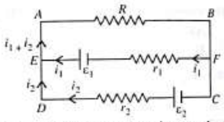
$= kl_2 - kl_1$ (Using (iv))

$= k(l_2 - l_1)\,\Omega$

25. (d) : Kirchhoff's junction law or Kirchhoff's first law is based on the conservation of charge. Kirchhoff's loop law or Kirchhoff's second law is based on the conservation of energy.

Hence both statements (A) and (B) are correct.

26. (d) :



Applying Kirchhoff's equation to the loop $ABFE$,

$-(i_1 + i_2)R - i_1 r_1 + \varepsilon_1 = 0$

or $\varepsilon_1 - (i_1 + i_2)R - i_1 r_1 = 0.$

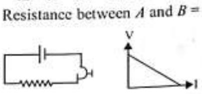
27. (d) : Wire of length $2\pi \times 0.1$ m of $12\,\Omega$/m is bent to a circle.

Resistance of each part

$= 12 \times \pi \times 0.1 = 1.2\pi\,\Omega$

$\therefore$ Resistance between A and $B = 0.6\pi\,\Omega$.

28. (a) :



$V = \varepsilon - Ir$, comparing with $y = c - mx$

$\therefore$ Slope $= -r$, internal resistance.

$V_{max} =$ emf ε. This is intercept on the y-axis.

$\therefore$ Slope is negative.

$\because$ I decreases as R increases.

29. (c) : Energy $= 2\,eV = eE\lambda$

$\therefore E = \frac{2eV}{e\lambda} = \frac{2}{4 \times 10^{-8}} = 5 \times 10^7$ V/m.

30. (b) : As the P.D. between $4\,\Omega$ and $3\,\Omega$ (in parallel) are the same,

$4 \times 1\text{ amp} = 3 \times i_1 \Rightarrow i_1 = \frac{4}{3}\,A$

Total resistance of $4\,\Omega$ and $3\,\Omega = 12/7\,\Omega$.

Current in MQP (upper one) $= 1 + \frac{4}{3} = \frac{7}{3}\,A$

$\therefore$ P.D. $= \frac{12}{7} \times \frac{7}{3} = 4\,V$

Current in $MNP = \frac{4}{1.25} = \frac{4 \times 4}{5} = \frac{16}{5}\,A$

$\therefore$ P.D. across $1\,\Omega = \frac{16}{5}\,A \times 1\,\Omega = \frac{16}{5}$ volt

$\Rightarrow$ P.D. across $1\,\Omega = 3.2$ volt.

31. (d) : $\frac{\Delta l}{l} = 0.1 \qquad \therefore l = 1.1$

but the area also decreases by 0.1.

mass $= \rho lA = V\rho$. $\qquad \ln l + \ln A = \ln$ mass.

$\therefore \frac{\Delta l}{l} + \frac{\Delta A}{A} = 0 \Rightarrow \frac{\Delta l}{l} = \frac{-\Delta A}{A}$

Length increases by 0.1, resistance increases, area decreases by 0.1, then also resistance will increase. Total increase in resistance is approximately 1.2 times, due to increase in length and decrease in area. But specific resistance does not change.

32. (c) : [In the question, the length 110 cm & 100 cm are interchanged] as $\varepsilon > \frac{\varepsilon R}{R+r}$

Without being short circuited through R, only the battery ε is balanced.

$\varepsilon = \frac{V}{L} \times l_1 = \frac{V}{L} \times 110$ cm ....(i)

When R is connected across ε,

$Ri = R \cdot \left(\frac{\varepsilon}{R+r}\right) = \frac{V}{L} \times l_2$

$\Rightarrow \frac{R\varepsilon}{R+r} = \frac{V}{L} \times 100$ .....(ii)

Dividing eqn. (i) and (ii), $\frac{(R+r)}{R} = \frac{110}{100}$

$\Rightarrow 1 + \frac{r}{R} = \frac{110}{100} \Rightarrow \frac{r}{R} = \frac{110}{100} - \frac{100}{100}$

$\Rightarrow r = R \cdot \frac{10}{100} = \frac{R}{10}$. As $R = 10\,\Omega$; $r = 1\,\Omega$.

33. (c) : Power $= 220\,V \times 4\,A = 880$ watts. $= 880$ J/s.

Heat needed to raise the temperature of 1 kg water through 80°C

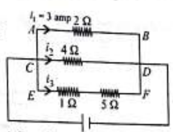
$= ms\Delta T \times 4.2$ J/cal

$= 1000\,g \times 1$ cal/g $\times 80 \times 4.2$ J/cal.

$\therefore$ time taken $= \frac{1000 \times 1 \times 80 \times 4.2}{880} = \frac{336 \times 10^3}{880}$

$= 382\,s = 6.3$ min.

34. (b) :



$2\,\Omega$, $4\,\Omega$ and $(1\,\Omega + 5\,\Omega)$ are in parallel.

So potential difference is the same.

$V = 2\,\Omega \cdot i_1 = 4\,\Omega \cdot i_2 = 6\,\Omega \cdot i_3$

$2 \cdot 3 = 6\,\Omega \cdot i_3 \Rightarrow i_3 = 1$ amp.

Total P.D. $= 5 \times 1 + 1 \times 1 = 6\,V$.

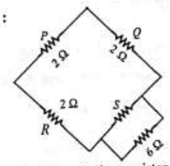
$\therefore$ Power dissipated in $5\,\Omega$ resistance

$= \frac{V'^2}{R}$

where V' is the P.D. across $5\,\Omega = 5\,V$.

$\therefore$ Power $= \frac{25\,V^2}{5\,\Omega} = 5$ watt

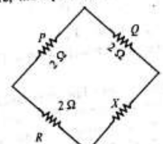
35. (a) :



Let X be the equivalent resistance between S and $6\,\Omega$.

$\therefore \quad \frac{1}{X} = \frac{1}{S} + \frac{1}{6}$ ... (i)

Therefore, the equivalent circuit diagram drawn below.



For a balanced Wheatstone bridge, we get

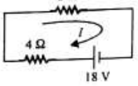
$\frac{P}{Q} = \frac{R}{X}$ or $\frac{2}{2} = \frac{2}{X} \Rightarrow X = 2\,\Omega$.

From eqn. (i), we get

$\frac{1}{2} = \frac{1}{S} + \frac{1}{6}$ or, $\frac{1}{S} = \frac{2}{6}$ or, $S = 3\,\Omega$.

36. (b) : In the given circuit 6 Ω and 3 Ω are in parallel, and hence its equivalent resistance is given by

$\frac{1}{R_p}=\frac{1}{6}+\frac{1}{3}$ or $R_p = 2\,\Omega.$

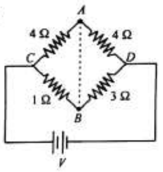


The equivalent circuit diagram is given in figure.
Total current in the circuit,

$I=\frac{18}{2+4}=3\text{ A}.$

Power in the circuit = VI = 18 × 3 = 54 watt.

37. (a) :



Current through arm CAD, $I=\frac{V}{8}$ amp

Potential difference between C and A = $V_C - V_A$

$=\frac{V}{8}\times 4=\frac{V}{2}$ volt

Current through CBD, $I'=\frac{V}{4}$ amp

Potential difference between C and B = $V_C - V_B$

$=\frac{V}{4}\times 1=\frac{V}{4}$ volt.

Potential between A and B = $V_A - V_B$

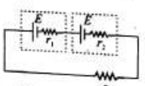
$\therefore\ V_A - V_B = V_C - V_B - (V_C - V_A) = \frac{V}{4}-\frac{V}{2}=-\frac{V}{4}.$

$\Rightarrow\ V_A - V_B < 0$ or, $V_A < V_B$

As $V_A < V_B$, so direction of current will be from B to A.

38. (c) : Kirchhoff's first law of electrical circuit is based on conservation of charge and Kirchhoff's second law of electrical circuit is based on conservation of energy.

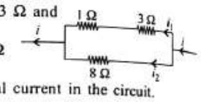
39. (b) : Kirchhoff's law has to be applied to the whole loop.



while $i=\frac{2E}{(r_1+r_2+R)}$,

If through one section (here the first battery) has zero potential difference, current cannot flow. The question could have been modified.
The statement that when the circuit is closed, the potential difference across the first cell is zero implies that in a series circuit, one part cannot conduct current which is wrong. Kirchhoff's law is violated.
Assuming that $ir_1 = E$ as given in the question paper, some students could have found that $R = r_1 - r_2$. They have to be given marks.

40. (a) : Resistance of series combination of 3 Ω and 1 Ω is



$R_1 = 3 + 1 = 4\,\Omega$
$R_2 = 8\,\Omega$
Let i be the total current in the circuit.

Current through R_1 is $i_1=\frac{i\times R_2}{R_1+R_2}=\frac{i\times 8}{12}=\frac{2i}{3}$

Current through R_2 is $i_2=\frac{i\times R_1}{R_1+R_2}=\frac{i\times 4}{12}=\frac{i}{3}$

Power dissipated in 3 Ω resistor is

$P_1 = i_1^2 \times 3$ ...(i)

Power dissipated in 8 Ω resistor is

$P_2 = i_2^2 \times 8$ ...(ii)

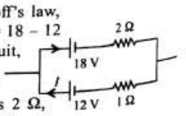
$\therefore\ \frac{P_1}{P_2}=\frac{i_1^2\times 3}{i_2^2\times 8}$ or, $\frac{P_1}{P_2}=\frac{(2i/3)^2\times 3}{(i/3)^2\times 8}=\frac{12}{8}=\frac{3}{2}.$

$P_1=\frac{3}{2}\times P_2=\frac{3}{2}\times 2=3$ watt

∴ Power dissipated across 3 Ω resistor is 3 watt.

41. (d) : From Kirchhoff's law,

$I\times 2 + I\times 1 = 18 - 12$



Current in the circuit,

$I=\frac{V}{R}=\frac{6}{3}=2\text{ A}$

Voltage drop across 2 Ω,

$V_1 = 2 \times 2 = 4$ V

Voltmeter reading = 18 − 4 = 14 V.

42. (a) : Both are in parallel.

$\frac{1}{R'}=\frac{2}{R}+\frac{2}{R}=\frac{4}{R}\ \Rightarrow\ R'=\frac{R}{4}.$

43. (d) : Since given circuit is in the form of Wheatstone bridge,

$\frac{1}{R_{eq}}=\frac{1}{(4+2)}+\frac{1}{(6+3)};\quad R_{eq} = 18/5\,\Omega$

$V = iR_{eq}\ \Rightarrow\ i=\frac{V}{R_{eq}}=\frac{5V}{18}.$

44. (a) : $P = i^2R$

$1 = 25 \times R$

$R=\frac{1}{25}=0.04\,\Omega$

45. (b) : Resistance of wire = $\rho\frac{l}{A}$

$R\propto\frac{l}{A}=\frac{l}{\pi r^2}$

When length and radius are both doubled

$R_1\propto\frac{2l}{\pi(2r)^2}\Rightarrow R_1\propto\frac{1}{2}R$

The specific resistance of wire is independent of geometry of the wire, it only depends on the material of the wire.

46. (a) : When n resistance of r ohm connected in parallel then their equivalent resistance is

$\Rightarrow\frac{1}{R}=\frac{1}{r}+\frac{1}{r}+\frac{1}{r}+$ ....n times

$\therefore\ \frac{1}{R}=\frac{n}{r}\Rightarrow R=\frac{r}{n}\Rightarrow r = nR$

When these resistance connected in series

$R_s = r + r +$ ....n times

$= nr = n \times nR = n^2R$

47. (c) : Equivalent circuit of given circuit is shown in figure (i).

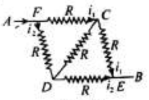


Fig. (i)

Also this is equivalent to a balanced Wheatstone's bridge, C and D are at equal potential level, no current will flow in this resistance therefore this resistance can be neglected.

Fig. (ii)

Thus equivalent resistance of this remaining circuit [in fig. (ii)] is R.

Then current in $AFCEB$ branch is

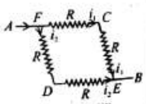

Fig. (iii)

$i_1=\frac{V}{R}\times\frac{2R}{2R+2R}=\frac{V}{2R}$

48. (c) : According to given parameters in question

$\Rightarrow R=\rho\frac{l}{A}\Rightarrow 100\,\Omega=\rho\frac{3}{A}\ \Rightarrow\frac{\rho}{A}=\frac{100}{3}.$

Thus total resistance of 50 cm wire is

$R_1=\frac{\rho}{A}l=\frac{100}{3}\times 0.5=\frac{50}{3}\,\Omega$

The total current in the wire is $I=\frac{6}{100}$ A.

Therefore potential difference across the two points on the wire separated by a distance of 50 m is

$(V) = IR_1=\frac{50}{3}\times\frac{6}{100}=1\text{ V}.$

49. (d) : The resistance of each bulb is $=\frac{V^2}{P}=\frac{(200)^2}{60}\Omega$

When three bulbs are connected in series their resultant resistance $=\frac{3\times(200)^2}{60}$.

Thus power drawn by bulb when connected across 200 V supply

$P=\frac{V^2}{R_{re}}=\frac{(200)^2}{3\times(200)^2/60}=20\text{ W}.$

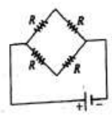
50. (c) : In India, $P_I=\frac{(220)^2}{R}$

In USA, $P_U=\frac{(110)^2}{R_U}$

as $P_I = P_U\ \Rightarrow\frac{(220)^2}{R}=\frac{(110)^2}{R_U}$

$\Rightarrow R_U=\frac{110\times 110}{220\times 220}R=\frac{R}{4}.$

51. (c) : In balance Wheatstone bridge, the galvanometer arm can be neglected so equivalent resistance = R.



52. (d) : $R=\frac{V^2}{P}=\frac{220\times 220}{100}=484\,\Omega$

In series, $R_{eq} = 484 + 484 = 968\,\Omega$

$\therefore\ P_{eq}=\frac{V^2}{968}=\frac{220\times 220}{968}=50$ watt

In parallel, $R_{eq} = 242\,\Omega$

$\therefore P_{eq} = \frac{V^2}{242} = \frac{220 \times 220}{242} = 200$ watt.

53. (a) : Let R_1 and R_2 be the resistance of the two coils and V be the voltage supplied.

Effective resistance of two coils in parallel

$= \frac{R_1 R_2}{R_1 + R_2}$

Let H be the heat required to begin boiling in kettle.

Then $H = \text{Power} \times \text{time} = \frac{V^2 t_1}{R_1} = \frac{V^2 t_2}{R_2}$

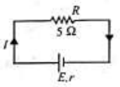
For parallel combination, $H = \frac{V^2 (R_1 + R_2) t_p}{R_1 R_2}$

$\Rightarrow \frac{1}{t_p} = \left(\frac{t_2 + t_1}{t_2 t_1}\right)$

$\therefore t_p = \frac{t_1 t_2}{t_1 + t_2} = \frac{10 \times 40}{10 + 40} = 8$ minute.

54. (b) : Fuse wire should have high resistance and low melting point.

55. (a) : Terminal potential difference is 2.2 V when circuit is open.



$\therefore$ e.m.f. of the cell

$= E = 2.2$ volt

Now, when the cell is connected to the external resistance, circuit current I is given by

$I = \frac{E}{R+r} = \frac{2.2}{5+r}$ ampere, where r is the internal resistance of the cell.

Potential difference across the cell $= IR$

$= \frac{2.2}{5+r} \times 5 = 1.8.$

$\therefore 5 + r = 11/1.8.$

$\therefore r = \frac{11}{1.8} - 5 = \frac{110-90}{18} = \frac{10}{9} \Omega.$

56. (a) : Resistance of a conductor is given by

$R = \rho \frac{l}{A}$, where ρ is the specific resistance, l is the length and A is the cross-sectional area of the conductor.

Now, when $l = 1$ and $A = 1$, $R = \rho$.

So specific resistance or resistivity of a material may be defined as the resistance of a specimen of the material having unit length and unit cross-section.

Hence, specific resistance is a property of a material and it will increase with the increase of temperature, but will not vary with the dimensions (length, cross-section) of the conductor.

57. (a) : For metals specific resistance decrease with decrease in temperature whereas for semiconductors specific resistance increases with decrease in temperature.

58. (a) : Balanced bridge

$\therefore$ $10\,\Omega$

59. (a) : $\frac{V}{l} = \frac{IR}{l} = \frac{I\rho l}{Al} = \frac{0.1 \times 10^{-7}}{10^{-6}} = 0.01 = 10^{-2}$ V/m

60. (b) : This is a balanced Wheatstone's bridge so no current flows through the 7 Ω resistor.

$\therefore \frac{1}{R_{eq}} = \frac{1}{4+3} + \frac{1}{6+8}$ or $R_{eq} = \frac{14}{3} \Omega$

61. (c) : $\frac{V-E}{r} = I \Rightarrow \frac{V-12}{5 \times 10^{-2}} = 60 \Rightarrow V = 15$ V

62. (b) : $P = \frac{V^2}{R}$ or, $R \propto \frac{1}{P}$

$\therefore R_{40} > R_{100}.$

63. (a)

64. (d) : In given circuit R_B and R_C are in series.

$\therefore R_{BC} = 6 + 6 = 12\,\Omega.$

Now, R_A and R_{BC} are in parallel.

Therefore, equivalent resistance of circuit,

$R_{eq} = \frac{12 \times 3}{12 + 3} = \frac{36}{15}.$

Using Ohm's law, $I = \frac{V}{R_{eq}} = \frac{4.8}{36/15} = 2$ A.

65. (a) : $i = \frac{2}{4} = 0.5$ Ampere

$V = \varepsilon - ir$

or $V = 2 - 0.5 \times 0.1 = 1.95$ V

66. (d) : Metre bridge works on the principle of Wheatstone bridge.

$\therefore \frac{P}{Q} = \frac{l}{100-l}$ or, $P = \frac{l}{100-l} \times Q$

$= \frac{20}{80} \times 1 = 0.25\,\Omega.$

67. (c) : $i = \frac{2}{10} = 0.2$ A, $\frac{R}{l} = 10/4$

Potential difference per unit length

$= 0.2 \times (10/4) = 0.5$ V/m

68. (a)

69. (d) : For series, $R_{eq.} = 3r$

Power $= \frac{V^2}{3r} = 10 \Rightarrow \frac{V^2}{r} = 30.$

For parallel $R_{eq.} = r/3$

power $= \frac{V^2}{r/3} = \frac{3V^2}{r} = 3 \times 30 = 90$ watt.

70. (a) : $H = I^2Rt = ms\Delta T$

$\frac{I_1^2}{I_2^2} = \frac{\Delta T_1}{\Delta T_2}$ or, $\Delta T_2 = \frac{\Delta T_1 I_2^2}{I_1^2}$

$\Delta T_2 = 5 \times \frac{(2I_1)^2}{I_1^2} = 20; \quad \Delta T_2 = 20°\text{C}.$

71. (a) : Three wires of lengths and cross-sectional areas $= (l, A)$, $(2l, A/2)$ and $(l/2, 2A)$.

Resistance of a wire $(R) \propto \frac{l}{A}$.

For I[st] wire, $R_1 \propto l/A = R$

For II[nd] wire, $R_2 \propto \frac{2l}{A/2} = 4R$

For III[rd] wire, $R_3 \propto \frac{l/2}{2A} = \frac{R}{4}$

Therefore resistance of the wire will be minimum for III[rd] wire.

72. (b) : Applied voltage $(V) = 2$V and resistances $= 3\Omega, 3\Omega, 3\Omega$.

From the given circuit, we find that two resistances are in series and third resistance is in parallel. Therefore equivalent resistance for series resistances $= 3 + 3 = 6\Omega$. Now it is connected parallel with 3Ω resistance. Therefore

$\frac{1}{R} = \frac{1}{3} + \frac{1}{6} = \frac{3}{6} = \frac{1}{2}$ or $R = 2\,\Omega.$

And current flowing in the circuit (I)

$= \frac{V}{R} = \frac{2}{2} = 1$ A.

73. (c)

74. (a) : For the negative resistance, when we increase the voltage, the current will decrease. Therefore from the graph, we find that the current in CD is decreased when voltage is increased.

75. (c) : Power = 100 W; Voltage of bulb = 200 V and supply voltage $(V_s) = 160$ V.

Therefore resistance of bulb (R)

$= \frac{V^2}{P} = \frac{(200)^2}{100} = 400\,\Omega$

and power consumption (P)

$= \frac{V_s^2}{R} = \frac{(160)^2}{400} = 64$ W.

76. (c) : 1 kWh = 1000 Wh

$= (1000\text{ W}) \times (3600\text{ s})$

$= 36 \times 10^5$ J.

77. (d) : Ratio of resistance $R_1 : R_2 = 1 : 2$ or $\frac{R_1}{R_2} = \frac{1}{2}$.

In series combination, power dissipated $(P) = I^2R$

$\Rightarrow P \propto R$. Therefore $\frac{P_1}{P_2} = \frac{R_1}{R_2} = \frac{1}{2}$

or $P_1 : P_2 = 1 : 2.$

78. (a) : Lower resistance on extreme left and upper resistance on extreme right are ineffective.

The resistance R_2 and R_3 are in series combination. Therefore their equivalent resistance,

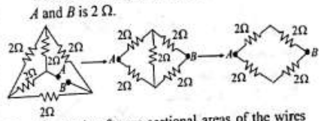
$R' = R_2 + R_3 = 10 + 10 = 20\,\Omega$. Similarly, the resistance R_5 and R_6 are in series combination. Therefore their equivalent resistance, R'' $= R_5 + R_6 = 10 + 10 = 20\,\Omega$. Now the equivalent resistances R' and R'' are in parallel combination. Therefore their equivalent resistance,

$R''' = \frac{R'R''}{R' + R''} = \frac{20 \times 20}{20 + 20} = \frac{400}{40} = 10\,\Omega.$

Thus equivalent resistance between A and D, R $= R_1 + R''' + R_4 = 10 + 10 + 10 = 30\,\Omega$

($\because$ series combination)

79. (d) : The circuit is equivalent to a balanced Wheatstone bridge. Therefore resistance between A and B is 2 Ω.



80. (a) : Ratio of cross-sectional areas of the wires $= 3 : 1$ and resistance of thick wire $(R_1) = 10\,\Omega$.

Resistance $(R) = \rho \frac{l}{A} \propto \frac{1}{A}$.

Therefore $\frac{R_1}{R_2} = \frac{A_2}{A_1} = \frac{1}{3}$ or $R_2 = 3R_1 = 3 \times 10 = 30\,\Omega$

and equivalent resistance of these two resistances in series combination

$= R_1 + R_2 = 30 + 10 = 40\,\Omega.$

81. (a)

82. (b) : Power of heating coil = 100 W and voltage (V) = 220 volts. When the heating coil is cut into two equal parts and these parts are joined in parallel, the resistance of the coil is reduced to one-fourth of the previous value. Therefore energy liberated per second becomes 4 times. *i.e.* 4 × 100 = 400 W.

83. (d) : Capacitance (C) = 4 μF = 4×10^{-6} F; Voltage (V) = 400 volts and resistance (R) = 2 kΩ = 2×10^3 Ω.

Heat produced = Electrical energy stored = $\frac{1}{2}CV^2$

$= \frac{1}{2} \times (4 \times 10^{-6}) \times (400)^2 = 0.32$ J.

84. (b) : Length (l) = 50 cm = 0.5 m;

Area (A) = 1 mm² = 1×10^{-6} m²;

Current (I) = 4A and voltage (V) = 2 volts.

Resistance (R) = $\frac{V}{I} = \frac{2}{4} = 0.5\ \Omega$ and

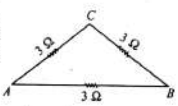
Resistivity (ρ) = $R \times \frac{A}{l} = 0.5 \times \frac{1 \times 10^{-6}}{0.5}$

$= 1 \times 10^{-6}\ \Omega$.m.

84. (a) : Resistances R_{AF} and R_{FE} are in series combination. Therefore their equivalent resistance $R' = R_{AF} + R_{FE} = 3 + 3 = 6\ \Omega$. Now the resistance R_{AE} and equivalent resistance R' are in parallel combination. Therefore relation for their equivalent resistance

$$\frac{1}{R''} = \frac{1}{R'} + \frac{1}{R_{AE}} = \frac{1}{6} + \frac{1}{6} = \frac{2}{6} = \frac{1}{3} \Rightarrow R'' = 3\ \Omega$$

We can calculate in the same manner for R_{ED}, R_{AC}, R_{DC} etc. and finally the circuit reduces as shown in the figure.



Therefore, the equivalent resistance between A and B

$= \frac{(3+3) \times 3}{(3+3)+3} = \frac{18}{9} = 2\ \Omega$.

86. (a) : Flow of electrons, $\frac{n}{t} = 10^7$/sec.

Therefore, current (I) = $\frac{q}{t} = \frac{ne}{t} = \frac{n}{t} \times e$

$= 10^7 \times (1.6 \times 10^{-19}) = 1.6 \times 10^{-12}$ A

87. (c)

88. (d) : Power (P) = 60 W and voltage (V) = 220 volts

Resistance of the filament, $R = \frac{V^2}{P} = \frac{(220)^2}{60} = 807\ \Omega$

89. (d) : The two resistances are connected in series and the resultant is connected in parallel with the third resistance.

$\therefore \quad R = 4\ \Omega + 4\ \Omega = 8\ \Omega$ and $\frac{1}{R''} = \frac{1}{8} + \frac{1}{4} = \frac{3}{8}$

or $R'' = \frac{8}{3}\ \Omega$

90. (c) : Current across 3 Ω = 0.8 A
6 Ω is in parallel, current across 6 Ω = 0.4 A
Total current = 1.2 A
∴ potential difference across 4 Ω resistor = 1.2 A × 4 Ω
= 4.8 V.

91. (a) : The output power of a cell is given by

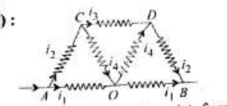
$$P = \frac{V^2}{(r+R)^2} R$$

Maximum power is delivered to the load only when the internal resistance of the source is equal to the load resistance (R). Then

$$P_{max} = \frac{V^2}{4R} = \frac{V^2}{4r} \quad (r = R)$$

92. (a)

93. (d) :



By symmetry, currents i_1 and i_2 from A is the same as i_1 and i_2 reaching B.
As the same current is flowing from A to O and O to B, O can be treated as detached from AB.
Now CO and OD will be in series hence its total resistance = 2 Ω
It is in parallel with CD so equivalent resistance

$= \frac{2 \times 1}{2+1} = \frac{2}{3}\ \Omega$

This equivalent resistance is in series with AC and DB So total resistance = $\frac{2}{3} + 1 + 1 = \frac{8}{3}\ \Omega$

Now $\frac{8}{3}\ \Omega$ is parallel to AB that is 2 Ω so total resistance = $\frac{(8/3) \times 2}{(8/3)+2} = \frac{16/3}{14/3} = \frac{16}{14} = \frac{8}{7}\ \Omega$

94. (b) : For maximum current, the two batteries should be connected in series. The current will be maximum when external resistance is equal to the total internal resistance of cells i.e. 2 Ω. Hence power developed across the resistance R will be

$$I^2 R = \left(\frac{2E}{R+2r}\right)^2 R = \left(\frac{2 \times 2}{2+2}\right)^2 \times 2 = 2\ \text{W}$$

95. (c) : To carry a current of 4 ampere, we need four path, each carrying a current of one ampere. Let r be the resistance of each path. These are connected in parallel. Hence their equivalent resistance will be $r/4$. According to the given problem $\frac{r}{4} = 5$ or $r = 20\ \Omega$.
For this purpose two resistances should be connected. There are four such combinations. Hence, the total number of resistance = 4 × 2 = 8

96. (b) : H = I^2Rt or $R = \frac{H}{(I^2 t)} = \frac{80}{(2^2 \times 10)} = 2\ \Omega$

97. (b) : Since, the voltage is same for the two combinations, the resistance is less for 39 bulbs. Hence the combination of 39 bulbs will glow more as current is more.

98. (c) : In series $R_s = nR$

In parallel $\frac{1}{R_p} = \frac{1}{R} + \frac{1}{R} + \ldots n \text{ terms} = \frac{n}{R}$

$\Rightarrow \quad R_p = \frac{R}{n}$

$\therefore \quad R_s/R_p = n^2/1$

99. (a) : $I = \frac{8-4}{1+2+9} = \frac{4}{12} = \frac{1}{3}$ A

$V_P - V_Q = 4 - \frac{1}{3} \times 3 = 3$ Volt

100. (d) : $m = l \times$ area × density

Area $\propto \frac{m}{l}$

$R \propto \frac{l}{\text{Area}} \propto \frac{l^2}{m}$

$R_1 : R_2 : R_3 = \frac{l_1^2}{m_1} : \frac{l_2^2}{m_2} : \frac{l_3^2}{m_3}$

$R_1 : R_2 : R_3 = \frac{25}{1} : \frac{9}{3} : \frac{1}{5} = 125 : 15 : 1$

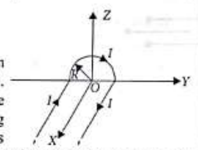
CHAPTER

14 Moving Charges and Magnetism

1. A proton and an alpha particle both enter a region of uniform magnetic field B, moving at right angles to the field B. If the radius of circular orbits for both the particles is equal and the kinetic energy acquired by proton is 1 MeV, the energy acquired by the alpha particle will be
(a) 1.5 MeV (b) 1 MeV
(c) 4 MeV (d) 0.5 MeV
(AIPMT 2015)

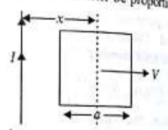
2. An electron moving in a circular orbit of radius r makes n rotations per second. The magnetic field produced at the centre has magnitude
(a) $\frac{\mu_0 n^2 e}{r}$ (b) $\frac{\mu_0 ne}{2r}$
(c) $\frac{\mu_0 ne}{2\pi r}$ (d) Zero
(AIPMT 2015, Cancelled)

3. A wire carrying current I has the shape as shown in adjoining figure. Linear parts of the wire are very long and parallel to X-axis while semicircular portion of radius R is lying in Y-Z plane. Magnetic field at point O is



(a) $\vec{B} = -\frac{\mu_0}{4\pi}\frac{I}{R}\left(\pi\hat{i}+2\hat{k}\right)$
(b) $\vec{B} = \frac{\mu_0}{4\pi}\frac{I}{R}\left(\pi\hat{i}-2\hat{k}\right)$
(c) $\vec{B} = \frac{\mu_0}{4\pi}\frac{I}{R}\left(\pi\hat{i}+2\hat{k}\right)$
(d) $\vec{B} = -\frac{\mu_0}{4\pi}\frac{I}{R}\left(\pi\hat{i}-2\hat{k}\right)$
(AIPMT 2015, Cancelled)

4. A conducting square frame of side 'a' and a long straight wire carrying current I are located in the same plane as shown in the figure. The frame moves to the right with a constant velocity 'V'. The emf induced in the frame will be proportional to



(a) $\frac{1}{(2x+a)^2}$ (b) $\frac{1}{(2x-a)(2x+a)}$
(c) $\frac{1}{x^2}$ (d) $\frac{1}{(2x-a)^2}$
(AIPMT 2015, Cancelled)

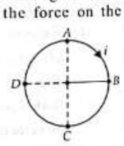
5. In an ammeter 0.2% of main current passes through the galvanometer. If resistance of galvanometer is G, the resistance of ammeter will be
(a) $\frac{1}{499}G$ (b) $\frac{499}{500}G$
(c) $\frac{1}{500}G$ (d) $\frac{500}{499}G$
(AIPMT 2014)

6. Two identical long conducting wires AOB and COD are placed at right angle to each other, with one above other such that O is their common point for the two. The wires carry I_1 and I_2 currents, respectively. Point P is lying at distance d from O along a direction perpendicular to the plane containing the wires. The magnetic field at the point P will be
(a) $\frac{\mu_0}{2\pi d}\left(\frac{I_1}{I_2}\right)$ (b) $\frac{\mu_0}{2\pi d}(I_1+I_2)$
(c) $\frac{\mu_0}{2\pi d}(I_1^2-I_2^2)$ (d) $\frac{\mu_0}{2\pi d}(I_1^2+I_2^2)^{1/2}$
(AIPMT 2014)

7. When a proton is released from rest in a room, it starts with an initial acceleration a_0 towards west. When it is projected towards north with a speed v_0 it moves with an initial acceleration $3a_0$ toward west. The electric and magnetic fields in the room are
(a) $\frac{ma_0}{e}$ east, $\frac{3ma_0}{ev_0}$ up
(b) $\frac{ma_0}{e}$ east, $\frac{3ma_0}{ev_0}$ down
(c) $\frac{ma_0}{e}$ west, $\frac{2ma_0}{ev_0}$ up
(d) $\frac{ma_0}{e}$ west, $\frac{2ma_0}{ev_0}$ down *(NEET 2013)*

8. A long straight wire carries a certain current and produces a magnetic field 2×10^{-4} Wb m^{-2} at a perpendicular distance of 5 cm from the wire. An electron situated at 5 cm from the wire moves with a velocity 10^7 m/s towards the wire along perpendicular to it. The force experienced by the electron will be (charge on electron 1.6×10^{-19} C)
(a) 3.2 N (b) 3.2×10^{-16} N
(c) 1.6×10^{-16} N (d) zero
(Karnataka NEET 2013)

9. A circular coil $ABCD$ carrying a current 'i' is placed in a uniform magnetic field. If the magnetic force on the segment AB is $\vec{F}$, the force on the remaining segment $BCDA$ is



(a) $-\vec{F}$
(b) $3\vec{F}$
(c) $-3\vec{F}$
(d) $\vec{F}$
(Karnataka NEET 2013)

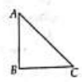
10. Two similar coils of radius R are lying concentrically with their planes at right angles to each other. The currents flowing in them are I and $2I$, respectively. The resultant magnetic field induction at the centre will be
(a) $\frac{\sqrt{5}\mu_0 I}{2R}$ (b) $\frac{\sqrt{5}\mu_0 I}{2R}$
(c) $\frac{\mu_0 I}{2R}$ (d) $\frac{\mu_0 I}{R}$ *(Prelims 2012)*

11. A milli voltmeter of 25 milli volt range is to be converted into an ammeter of 25 ampere range. The value (in ohm) of necessary shunt will be
(a) 0.001 (b) 0.01
(c) 1 (d) 0.05 *(Prelims 2012)*

12. An alternating electric field, of frequency υ, is applied across the dees (radius = R) of a cyclotron that is being used to accelerate protons (mass = m). The operating magnetic field (B) used in the cyclotron and the kinetic energy (K) of the proton beam, produced by it, are given by
(a) $B = \frac{m\upsilon}{e}$ and $K = 2m\pi^2\upsilon^2R^2$
(b) $B = \frac{2\pi m\upsilon}{e}$ and $K = m^2\pi\upsilon R^2$
(c) $B = \frac{2\pi m\upsilon}{e}$ and $K = 2m\pi^2\upsilon^2R^2$
(d) $B = \frac{m\upsilon}{e}$ and $K = m^2\pi\upsilon R^2$ *(Prelims 2012)*

13. A proton carrying 1 MeV kinetic energy is moving in a circular path of radius R in uniform magnetic field. What should be the energy of an α-particle to describe a circle of same radius in the same field?
(a) 2 MeV (b) 1 MeV
(c) 0.5 MeV (d) 4 MeV *(Mains 2012)*

14. A current carrying closed loop in the form of a right angle isosceles triangle ABC is placed in a uniform magnetic field acting along AB. If the magnetic force on the arm BC is $\vec{F}$, the force on the arm AC is



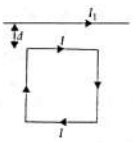
(a) $-\sqrt{2}\vec{F}$
(b) $-\vec{F}$
(c) $\vec{F}$
(d) $\sqrt{2}\vec{F}$ *(Prelims 2011)*

15. A uniform electric field and a uniform magnetic field are acting along the same direction in a certain region. If an electron is projected in the region such that its velocity is pointed along the direction of fields, then the electron
(a) will turn towards right of direction of motion
(b) speed will decrease
(c) speed will increase
(d) will turn towards left of direction of motion
(Prelims 2011)

16. A galvanometer of resistance, G, is shunted by a resistance S ohm. To keep the main current in the circuit unchanged, the resistance to be put in series with the galvanometer is
(a) $\frac{G}{(S+G)}$ (b) $\frac{S^2}{(S+G)}$
(c) $\frac{SG}{(S+G)}$ (d) $\frac{G^2}{(S+G)}$ *(Mains 2011)*

17. Charge q is uniformly spread on a thin ring of radius R. The ring rotates about its axis with a uniform frequency f Hz. The magnitude of magnetic induction at the center of the ring is
(a) $\frac{\mu_0 qf}{2\pi R}$ (b) $\frac{\mu_0 qf}{2R}$
(c) $\frac{\mu_0 q}{2fR}$ (d) $\frac{\mu_0 q}{2\pi fR}$
(Mains 2011, Prelims 2010)

18. A square loop, carrying a teady current I, is placed in a horizontal plane near a long straight conductor carrying a steady current I_1 at a distance d from the conductor as shown in figure. The loop will experience



(a) a net attractive force towards the conductor
(b) a net repulsive force away from the conductor
(c) a net torque acting upward perpendicular to the horizontal plane
(d) a net torque acting downward normal to the horizontal plane *(Mains 2011)*

19. A galvanometer has a coil of resistance 100 ohm and gives a full scale deflection for 30 mA current. If it is to work as a voltmeter of 30 volt range, the resistance required to be added will be
(a) 900 Ω (b) 1800 Ω
(c) 500 Ω (d) 1000 Ω *(Prelims 2010)*

20. A square current carrying loop is suspended in a uniform magnetic field acting in the plane of the loop. If the force on one arm of the loop is the net force on the remaining three arms of the loop is
(a) $3\vec{F}$ (b) $-\vec{F}$
(c) $-3\vec{F}$ (d) $\vec{F}$ *(Prelims 2010)*

21. A current loop consists of two identical semicircular parts each of radius R, one lying in the x-y plane and the other in x-z plane. If the current in the loop is i. The resultant magnetic field due to the two semicircular parts at their common centre is
(a) $\frac{\mu_0 i}{2\sqrt{2}R}$ (b) $\frac{\mu_0 i}{2R}$
(c) $\frac{\mu_0 i}{4R}$ (d) $\frac{\mu_0 i}{\sqrt{2}R}$ *(Mains 2010)*

22. A closely wound solenoid of 2000 turns and area of cross-section 1.5×10^{-4} m^2 carries a current of 2.0 A. It is suspended through its centre and perpendicular to its length, allowing it to turn in a horizontal plane in a uniform magnetic field 5×10^{-2} tesla making an angle of 30° with the axis of the solenoid. The torque on the solenoid will be
(a) 3×10^{-3} N m (b) 1.5×10^{-3} N m
(c) 1.5×10^{-2} N m (d) 3×10^{-2} N m
(Mains 2010)

23. A particle having a mass of 10^{-2} kg carries a charge of 5×10^{-8} C. The particle is given an initial horizontal velocity of 10^5 m s^{-1} in the presence of electric field $\vec{E}$ and magnetic field $\vec{B}$. To keep the particle moving in a horizontal direction, it is necessary that
(1) $\vec{B}$ should be perpendicular to the direction of velocity and $\vec{E}$ should be along the direction of velocity
(2) Both $\vec{B}$ and $\vec{E}$ should be along the direction of velocity
(3) Both $\vec{B}$ and $\vec{E}$ are mutually perpendicular and perpendicular to the direction of velocity
(4) $\vec{B}$ should be along the direction of velocity and $\vec{E}$ should be perpendicular to the direction of velocity

Which one of the following pairs of statements is possible?
(a) (1) and (3) (b) (3) and (4)
(c) (2) and (3) (d) (2) and (4)
(Mains 2010)

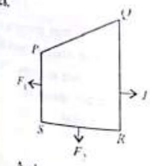
24. A galvanometer having a coil resistance of 60 Ω shows full scale deflection when a current of 1.0 amp passes through it. It can be converted into an ammeter to read currents upto 5.0 amp by
(a) putting in series a resistance of 15 Ω
(b) putting in series a resistance of 240 Ω
(c) putting in parallel a resistance of 15 Ω
(d) putting in parallel a resistance of 240 Ω
(Prelims 2009)

25. The magnetic force acting on a charged particle of charge $-2\ \mu C$ in a magnetic field of 2 T acting in y direction, when the particle velocity is is
(a) 4 N in z direction (b) 8 N in y direction
(c) 8 N in z direction (d) 8 N in $-z$ direction
(Prelims 2009)

26. Under the influence of a uniform magnetic field, a charged particle moves with constant speed v in a circle of radius R. The time period of rotation of the particle
(a) depends on R and not on v
(b) is independent of both v and R
(c) depends on both v and R
(d) depends on v and not on R
(Prelims 2009, 2007)

27. A particle of mass m, charge Q and kinetic energy T enters a transverse uniform magnetic field of induction $\vec{B}$. After 3 seconds the kinetic energy of the particle will be
(a) T (b) $4T$
(c) $3T$ (d) $2T$ *(Prelims 2008)*

28.



A closed loop $PQRS$ carrying a current is placed in a uniform magnetic field. If the magnetic forces on segments PS, SR and RQ are F_1, F_2 and F_3 respectively and are in the plane of the paper and along the directions shown, the force on the segment QP is
(a) $\sqrt{(F_3 - F_1)^2 - F_2^2}$ (b) $F_3 - F_1 + F_2$
(c) $F_3 - F_1 - F_2$ (d) $\sqrt{(F_3 - F_1)^2 + F_2^2}$
(Prelims 2008)

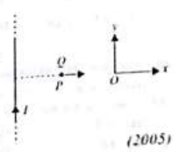
29. A galvanometer of resistance 50 Ω is connected to a battery of 3 V along with a resistance of 2950 Ω in series. A full scale deflection of 30 divisions is obtained in the galvanometer. In order to reduce this deflection to 20 divisions, the resistance in series should be
(a) 6050 Ω (b) 4450 Ω
(c) 5050 Ω (d) 5550 Ω
(Prelims 2008)

30. The resistance of an ammeter is 13 Ω and its scale is graduated for a current upto 100 amps. After an additional shunt has been connected to this ammeter it becomes possible to measure currents upto 750 amperes by this meter. The value of shunt-resistance is
(a) 2 Ω (b) 0.2 Ω
(c) 2 kΩ (d) 20 Ω. *(2007)*

31. When a charged particle moving with velocity $\vec{v}$ is subjected to a magnetic field of induction $\vec{B}$, the force on it is non-zero. This implies that
(a) angle between is either zero or 180°
(b) angle between is necessarily 90°
(c) angle between can have any value other than 90°
(d) angle between can have any value other than zero and 180°. *(2006)*

32. Two circular coils 1 and 2 are made from the same wire but the radius of the 1st coil is twice that of the 2nd coil. What potential difference in volts should be applied across them so that the magnetic field at their centres is the same?
(a) 2 (b) 3
(c) 4 (d) 6. *(2006)*

33. A very long straight wire carries a current I. At the instant when a charge $+Q$ at point P has velocity $\vec{v}$, as shown, the force on the charge is
(a) along Oy
(b) opposite to Oy
(c) along Ox
(d) opposite to Ox.



(2005)

34. An electron moves in a circular orbit with a uniform speed v. It produces a magnetic field B at the centre of the circle. The radius of the circle is proportional to

(a) $\sqrt{B/v}$ (b) B/v

(c) $\sqrt{v/B}$ (d) v/B *(2005)*

35. A galvanometer of 50 ohm resistance has 25 divisions. A current of 4×10^{-4} ampere gives a deflection of one division. To convert this galvanometer into a voltmeter having a range of 25 volts, it should be connected with a resistance of

(a) 2500 Ω as a shunt (b) 2450 Ω as a shunt

(c) 2550 Ω in series (d) 2450 Ω in series *(2004)*

36. To convert a galvanometer into a voltmeter one should connect a

(a) high resistance in series with galvanometer

(b) low resistance in series with galvanometer

(c) high resistance in parallel with galvanometer

(d) low resistance in parallel with galvanometer. *(2004, 2002)*

37. A charged particle moves through a magnetic field in a direction perpendicular to it. Then the

(a) speed of the particle remains unchanged

(b) direction of the particle remains unchanged

(c) acceleration remains unchanged

(d) velocity remains unchanged *(2003)*

38. A long solenoid carrying a current produces a magnetic field B along its axis. If the current is doubled and the number of turns per cm is halved, the new value of the magnetic field is

(a) $B/2$ (b) B

(c) $2B$ (d) $4B$ *(2003)*

39. A charge q moves in a region where electric field and magnetic field both exist, then force on it is

(a) $q(\vec{v} \times \vec{B})$ (b) $q\vec{E} + q(\vec{v} \times \vec{B})$

(c) $q\vec{E} + \vec{q}\,(\vec{B} \times \vec{v})$ (d) $q\vec{B} + q(\vec{E} \times \vec{v})$. *(2002)*

40. The magnetic field of given length of wire for single turn coil at its centre is B then its value for two turns coil for the same wire is

(a) $B/4$ (b) $B/2$

(c) $4B$ (d) $2B$. *(2002)*

41. If number of turns, area and current through a coil is given by n, A and i respectively then its magnetic moment will be

(a) niA (b) n^2iA

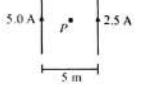
(c) niA^2 (d) $\frac{ni}{\sqrt{A}}$. *(2001)*

42. An electron having mass m and kinetic energy E enter in uniform magnetic field B perpendicularly, then its frequency will be

(a) $\frac{eE}{qvB}$ (b) $\frac{2\pi m}{eB}$

(c) $\frac{eB}{2\pi m}$ (d) $\frac{2m}{eBE}$. *(2001)*

43. The magnetic field at centre, P will be



(a) $\frac{\mu_0}{4\pi}$ (b) $\frac{\mu_0}{\pi}$

(c) $\frac{\mu_0}{2\pi}$ (d) $4\mu_0\pi$. *(2000)*

44. Magnetic field due to 0.1 A current flowing through a circular coil of radius 0.1 m and 1000 turns at the centre of the coil is

(a) 6.28×10^{-4} T (b) 4.31×10^{-2} T

(c) 2×10^{-1} T (d) 9.81×10^{-4} T *(1999)*

45. A straight wire of diameter 0.5 mm carrying a current of 1 A is replaced by the another wire of 1 mm diameter carrying the same current. The strength of the magnetic field far away is

(a) one-quarter of the earlier value

(b) one-half of the earlier value

(c) twice the earlier value

(d) same as the earlier value *(1999, 97)*

46. If a long hollow copper pipe carries a current, then produced magnetic field will be

(a) both inside and outside the pipe

(b) outside the pipe only

(c) inside the pipe only

(d) neither inside nor outside the pipe *(1999)*

47. Magnetic field intensity at the centre of coil of 50 turns, radius 0.5 m and carrying a current of 2 A, is

(a) 3×10^{-5} T (b) 1.25×10^{-4} T

(c) 0.5×10^{-5} T (d) 4×10^{6} T *(1999)*

48. A charge having e/m equal to 10^8 C/kg and with velocity 3×10^5 m/s enters into a uniform magnetic field $B = 0.3$ tesla at an angle 30° with direction of field. The radius of curvature will be

(a) 0.01 cm (b) 0.5 cm

(c) 1 cm (d) 2 cm. *(1999)*

49. Two long parallel wires are at a distance of 1 metre. Both of them carry one ampere of current. The force of attraction per unit length between the two wires is

(a) 5×10^{-8} N/m (b) 2×10^{-8} N/m

(c) 2×10^{-7} N/m (d) 10^{-7} N/m *(1998)*

50. A galvanometer having a resistance of 9 ohm is shunted by a wire of resistance 2 ohm. If the total current is 1 amp, the part of it passing through the shunt will be

(a) 0.2 amp (b) 0.8 amp

(c) 0.25 amp (d) 0.5 amp *(1998)*

51. A coil of one turn is made of a wire of certain length and then from the same length a coil of two turns is made. If the same current is passed in both the cases, then the ratio of the magnetic inductions at their centres will be

(a) 4 : 1 (b) 1 : 4

(c) 2 : 1 (d) 1 : 2 *(1998)*

52. Two parallel wires in free space are 10 cm apart and each carries a current of 10 A in the same direction. The force exerted by one wire on the other, per metre length is

(a) 2×10^{-4} N, repulsive

(b) 2×10^{-7} N, repulsive

(c) 2×10^{-4} N, attractive

(d) 2×10^{-7} N, attractive. *(1997)*

53. A positively charged particle moving due East enters a region of uniform magnetic field directed vertically upwards. This particle will

(a) move in a circular path with a decreased speed

(b) move in a circular path with a uniform speed

(c) get deflected in vertically upward direction

(d) move in circular path with an increased speed. *(1997)*

54. Tesla is the unit of

(a) electric field

(b) magnetic field

(c) electric flux

(d) magnetic flux. *(1997, 88)*

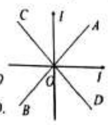
55. Two equal electric currents are flowing perpendicular to each other as shown in the figure. AB and CD are perpendicular to each other and symmetrically placed with respect to the currents. Where do we expect the resultant magnetic field to be zero?

(a) On CD

(b) On AB

(c) On both OD and BO

(d) On both AB and CD.



(1996)

56. The magnetic field $d\vec{B}$ due to a small current element $d\vec{l}$ at a distance $\vec{r}$ and element carrying current i is

(a) $d\vec{B} = \frac{\mu_0}{4\pi} i^2 \left(\frac{d\vec{l} \times \vec{r}}{r}\right)$

(b) $d\vec{B} = \frac{\mu_0}{4\pi} i \left(\frac{d\vec{l} \times \vec{r}}{r^3}\right)$

(c) $d\vec{B} = \frac{\mu_0}{4\pi} i \left(\frac{d\vec{l} \times \vec{r}}{r}\right)$

(d) $d\vec{B} = \frac{\mu_0}{4\pi} i^2 \left(\frac{d\vec{l} \times \vec{r}}{r^2}\right)$ *(1996)*

57. A 10 eV electron is circulating in a plane at right angles to a uniform field at magnetic induction 10^{-4} Wb/m^2 (= 1.0 gauss), the orbital radius of electron is

(a) 11 cm (b) 18 cm

(c) 12 cm (d) 16 cm. *(1996)*

58. A beam of electrons is moving with constant velocity in a region having electric and magnetic fields of strength 20 Vm^{-1} and 0.5 T at right angles to the direction of motion of the electrons. What is the velocity of the electrons?

(a) 8 ms^{-1} (b) 5.5 ms^{-1}

(c) 20 ms^{-1} (d) 40 ms^{-1}. *(1996)*

59. A circular loop of area 0.01 m^2 carrying a current of 10 A, is held perpendicular to a magnetic field of intensity 0.1 T. The torque acting on the loop is
(a) 0.001 N m (b) 0.8 N m
(c) zero (d) 0.01 N m. *(1994)*

60. A charge moving with velocity v in X-direction is subjected to a field of magnetic induction in negative X-direction. As a result, the charge will
(a) remain unaffected
(b) start moving in a circular path Y-Z plane
(c) retard along X-axis
(d) moving along a helical path around X-axis *(1993)*

61. A coil carrying electric current is placed in uniform magnetic field
(a) torque is formed
(b) e.m.f is induced
(c) both (a) and (b) are correct
(d) none of these *(1993)*

62. To convert a galvanometer into a ammeter, one needs to connect a
(a) low resistance in parallel
(b) high resistance in parallel
(c) low resistance in series
(d) high resistance in series *(1992)*

63. A straight wire of length 0.5 metre and carrying a current of 1.2 ampere is placed in uniform magnetic field of induction 2 tesla. The magnetic field is perpendicular to the length of the wire. The force on the wire is
(a) 2.4 N (b) 1.2 N
(c) 3.0 N (d) 2.0 N *(1992)*

64. The magnetic field at a distance r from a long wire carrying current i is 0.4 tesla. The magnetic field at a distance $2r$ is
(a) 0.2 tesla (b) 0.8 tesla
(c) 0.1 tesla (d) 1.6 tesla *(1992)*

65. A uniform magnetic field acts right angles to the direction of motion of electrons. As a result, the electron moves in a circular path of radius 2 cm. If the speed of electrons is doubled, then the radius of the circular path will be
(a) 2.0 cm (b) 0.5 cm
(c) 4.0 cm (d) 1.0 cm *(1991)*

66. A deuteron of kinetic energy 50 keV is describing a circular orbit of radius 0.5 metre in a plane perpendicular to magnetic field B. The kinetic energy of the proton that describes a circular orbit of radius 0.5 metre in the same plane with the same B is
(a) 25 keV (b) 50 keV
(c) 200 keV (d) 100 keV *(1991)*

67. The magnetic induction at a pont point P which is at the distance of 4 cm from a long current carrying wire is 10^{-3} T. The field of induction at a distance 12 cm from the current will be
(a) 3.33×10^{-4} T (b) 1.11×10^{-4} T
(c) 33×10^{-3} T (d) 9×10^{-3} T *(1990)*

68. Energy in a current carrying coil is stored in the form of
(a) electric field only
(b) magnetic field only
(c) dielectric strength
(d) both (a) and (b) *(1989)*

69. A current carrying coil is subjected to a uniform magnetic field. The coil will orient so that its plane becomes
(a) inclined at 45° to the magnetic field
(b) inclined at any arbitrary angle to the magnetic field
(c) parallel to the magnetic field
(d) perpendicular to magnetic field *(1988)*

EXPLANATIONS

1. (b): The kinetic energy acquired by a charged particle in a uniform magnetic field B is

$$K = \frac{q^2B^2R^2}{2m} \qquad \left(\text{as } R = \frac{mv}{qB} = \frac{\sqrt{2mK}}{qB}\right)$$

where q and m are the charge and mass of the particle and R is the radius of circular orbit.

∴ The kinetic energy acquired by proton is

$$K_p = \frac{q_p^2B^2R_p^2}{2m_p}$$

and that by the alpha particle is

$$K_\alpha = \frac{q_\alpha^2B^2R_\alpha^2}{2m_\alpha}$$

Thus, $\dfrac{K_\alpha}{K_p} = \left(\dfrac{q_\alpha}{q_p}\right)^2\left(\dfrac{m_p}{m_\alpha}\right)\left(\dfrac{R_\alpha}{R_p}\right)^2$

or $K_\alpha = K_p\left(\dfrac{q_\alpha}{q_p}\right)^2\left(\dfrac{m_p}{m_\alpha}\right)\left(\dfrac{R_\alpha}{R_p}\right)^2$

Here, $K_p = 1$ MeV, $\dfrac{q_\alpha}{q_p} = 2$, $\dfrac{m_p}{m_\alpha} = \dfrac{1}{4}$

and $\dfrac{R_\alpha}{R_p} = 1$

∴ $K_\alpha = (1\text{ MeV})(2)^2\left(\dfrac{1}{4}\right)(1)^2 = 1$ MeV

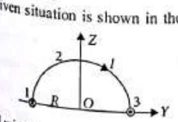
2. (b): Current in the orbit, $I = \dfrac{e}{T}$

$$I = \frac{e}{(2\pi/\omega)} = \frac{\omega e}{2\pi} = \frac{(2\pi n)e}{2\pi} = ne$$

Magnetic field at centre of current carrying circular coil is given by

$$B = \frac{\mu_0 I}{2r} = \frac{\mu_0 ne}{2r}$$

3. (a): Given situation is shown in the figure.



Parallel wires 1 and 3 are semi-infinite, so magnetic field at O due to them

$$\vec{B}_1 = \vec{B}_3 = -\frac{\mu_0 I}{4\pi R}\hat{k}$$

Magnetic field at O due to semi-circular arc in YZ-plane is given by $\vec{B}_2 = -\dfrac{\mu_0 I}{4R}\hat{i}$

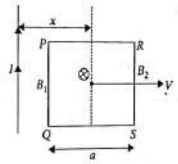
Net magnetic field at point O is given by

$$\vec{B} = \vec{B}_1 + \vec{B}_2 + \vec{B}_3$$

$$= -\frac{\mu_0 I}{4\pi R}\hat{k} - \frac{\mu_0 I}{4R}\hat{i} - \frac{\mu_0 I}{4\pi R}\hat{k}$$

$$= -\frac{\mu_0 I}{4\pi R}(\pi\hat{i} + 2\hat{k})$$

4. (b): Here, $PQ = RS = PR = QS = a$



Emf induced in the frame

$$\varepsilon = B_1(PQ)V - B_2(RS)V$$

$$= \frac{\mu_0 I}{2\pi(x - a/2)}aV - \frac{\mu_0 I}{2\pi(x + a/2)}aV$$

$$= \frac{\mu_0 I}{2\pi}\left[\frac{2}{(2x-a)} - \frac{2}{(2x+a)}\right]aV$$

$$= \frac{\mu_0 I}{2\pi} \times 2\left[\frac{2a}{(2x-a)(2x+a)}\right]aV$$

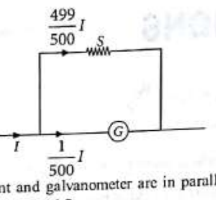
$$\therefore \quad \varepsilon \propto \frac{1}{(2x-a)(2x+a)}$$

5. (c): Here, resistance of the galvanometer = G
Current through the galvanometer,

$I_G = 0.2\%$ of $I = \dfrac{0.2}{100}I = \dfrac{1}{500}I$

∴ Current through the shunt,

$I_S = I - I_G = I - \dfrac{1}{500}I = \dfrac{499}{500}I$



As shunt and galvanometer are in parallel

$\therefore \quad I_G G = I_S S$

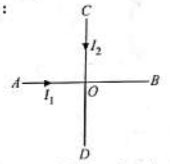
$\left(\frac{1}{500}I\right)G = \left(\frac{499}{500}\right)S$ or $S = \frac{G}{499}$

Resistance of the ammeter R_A is

$$\frac{1}{R_A} = \frac{1}{G} + \frac{1}{S} = \frac{1}{G} + \frac{1}{\frac{G}{499}} = \frac{500}{G}$$

$$R_A = \frac{1}{500}G$$

6. (d):



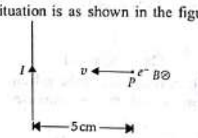
The magnetic field at the point P, at a perpendicular distance d from O in a direction perpendicular to the plane $ABCD$ due to currents through AOB and COD are perpendicular to each other. Hence,

$$B = (B_1^2 + B_2^2)^{1/2} = \left[\left(\frac{\mu_0}{4\pi}\frac{2I_1}{d}\right)^2 + \left(\frac{\mu_0}{4\pi}\frac{2I_2}{d}\right)^2\right]^{1/2}$$

$$= \frac{\mu_0}{2\pi d}(I_1^2 + I_2^2)^{1/2}$$

7. (d)

8. (b): The situation is as shown in the figure.



Here, $v = 10^7$ m/s, $B = 2 \times 10^{-4}$ Wb/m^2

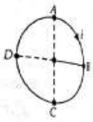
The magnitude of the force experienced by the electron is

$$F = evB\sin\theta$$

($\because$ $\vec{v}$ and $\vec{B}$ are perpendicular to each other)

$$= evB\sin 90^\circ$$
$$= 1.6 \times 10^{-19} \times 10^7 \times 2 \times 10^{-4} \times 1$$
$$= 3.2 \times 10^{-16}\text{ N}$$

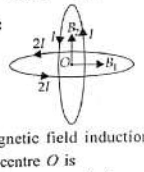
9. (a): The net magnetic force on a current loop in a uniform magnetic field is always zero.



$\therefore \quad \vec{F}_{AB} + \vec{F}_{BCDA} = 0$

$\vec{F}_{BCDA} = -\vec{F}_{AB} = -\vec{F}$

10. (a):



Magnetic field induction due to vertical loop at the centre O is

$$B_1 = \frac{\mu_0 I}{2R}$$

It acts in horizontal direction.

Magnetic field induction due to horizontal loop at the centre O is

$$B_2 = \frac{\mu_0 2I}{2R}$$

It acts in vertically upward direction.

As B_1 and B_2 are perpendicular to each other, therefore the resultant magnetic field induction at the centre O is

$$B_{net} = \sqrt{B_1^2 + B_2^2} = \sqrt{\left(\frac{\mu_0 I}{2R}\right)^2 + \left(\frac{\mu_0 2I}{2R}\right)^2}$$

$$B_{net} = \frac{\mu_0 I}{2R}\sqrt{(1)^2 + (2)^2} = \frac{\sqrt{5}\mu_0 I}{2R}$$

11. (a): $S = \frac{V_g}{(I - I_g)}$

Neglecting I_g

$$\therefore \quad S = \frac{V_g}{I} = \frac{25 \times 10^{-3}\text{ V}}{25\text{ A}} = 0.001\,\Omega$$

12. (c): Frequency, $\upsilon = \frac{eB}{2\pi m}$

or $B = \frac{2\pi m\upsilon}{e}$ ...(i)

As $\frac{mv^2}{R} = evB$

or $v = \frac{eBR}{m} = \frac{e2\pi m\upsilon R}{me}$ (Using (i))

$= 2\pi\upsilon R$ ...(ii)

Kinetic energy, $K = \frac{1}{2}mv^2 = \frac{1}{2}m(2\pi\upsilon R)^2$ (Using (ii))

$= 2m\pi^2\upsilon^2R^2$

13. (b): Kinetic energy of a charged particle,

$$K = \frac{1}{2}mv^2 \text{ or } v = \sqrt{\frac{2K}{m}}$$

Radius of the circular path of a charged particle in uniform magnetic field is given by

$$R = \frac{mv}{Bq} = \frac{m}{Bq}\sqrt{\frac{2K}{m}} = \frac{\sqrt{2mK}}{Bq}$$

Mass of a proton, $m_p = m$

Mass of an α-particle, $m_\alpha = 4m$

Charge of a proton, $q_p = e$

Charge of an α-particle, $q_\alpha = 2e$

$$\therefore \quad R_p = \frac{\sqrt{2m_pK_p}}{Bq_p} = \frac{\sqrt{2mK_p}}{Be}$$

and $R_\alpha = \frac{\sqrt{2m_\alpha K_\alpha}}{Bq_\alpha} = \frac{\sqrt{2(4m)K_\alpha}}{B(2e)} = \frac{\sqrt{2mK_\alpha}}{Be}$

$$\therefore \quad \frac{R_p}{R_\alpha} = \sqrt{\frac{K_p}{K_\alpha}}$$

As $R_p = R_\alpha$ (given)

$\therefore K_\alpha = K_p = 1$ MeV

14. (b): Here, $\vec{F}_{BC} = \vec{F}$

$\because \quad \vec{F}_{AB} = 0$

The net magnetic force on a current carrying closed loop in a uniform magnetic field is zero.

$\therefore \quad \vec{F}_{AB} + \vec{F}_{BC} + \vec{F}_{AC} = 0$

$\Rightarrow \quad \vec{F}_{AC} = -\vec{F}_{BC} \qquad (\because \ \vec{F}_{AB} = 0)$

15. (b): Force on electron due to electric field,

$\vec{F}_E = -e\vec{E}$

Force on electron due to magnetic field,

$\vec{F}_B = -e(\vec{v} \times \vec{B}) = 0$

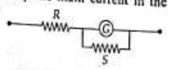
Since $\vec{v}$ and $\vec{B}$ are in the same direction.

Total force on the electron,

$\vec{F} = \vec{F}_E + \vec{F}_B = -e\vec{E}$

Electric field opposes the motion of the electron, hence speed of the electron will decrease.

16. (d): Let resistance R is to be put in series with galvanometer G to keep the main current in the circuit unchanged.



$$\therefore \quad \frac{GS}{G+S} + R = G$$

$$R = G - \frac{GS}{G+S} \Rightarrow R = \frac{G^2 + GS - GS}{G+S}$$

$$R = \frac{G^2}{G+S}$$

17. (b): The current flowing in the ring is

$I = qf$ ...(i)

The magnetic induction at the centre of the ring is

$B = \frac{\mu_0 2\pi I}{4\pi R} = \frac{\mu_0 qf}{2R}$ (Using (i))

18. (a)

19. (a): Here,

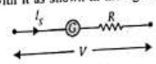
Resistance of galvanometer, $G = 100\ \Omega$

Current for full scale deflection, $I_g = 30$ mA

$= 30 \times 10^{-3}$ A

Range of voltmeter, $V = 30$ V

To convert the galvanometer into an voltmeter of a given range, a resistance R is connected in series with it as shown in the figure.



From figure,

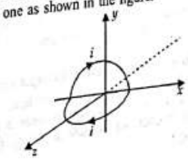
$V = I_g(G + R)$

or $\quad R = \frac{V}{I_g} - G = \frac{30}{30 \times 10^{-3}} - 100\,\Omega$

$= 1000 - 100 = 900\,\Omega$

20. (b)

21. (a): The loop mentioned in the question must look like one as shown in the figure.



Scanned by CamScanner

Magnetic field at the centre due to semicircular loop lying in x-y plane, $B_{xy} = \frac{1}{2}\left(\frac{\mu_0 i}{2R}\right)$ negative z direction.

Similarly field due to loop in x-z plane, $B_{xz} = \frac{1}{2}\left(\frac{\mu_0 i}{2R}\right)$ in negative y direction.

$\therefore$ Magnitude of resultant magnetic field,

$$B = \sqrt{B_{xy}^2 + B_{xz}^2} = \sqrt{\left(\frac{\mu_0 i}{4R}\right)^2 + \left(\frac{\mu_0 i}{4R}\right)^2}$$

$$= \frac{\mu_0 i}{4R}\sqrt{2} = \frac{\mu_0 i}{2\sqrt{2}R}$$

22. **(c)** : Magnetic moment of the loop.

$M = NIA = 2000 \times 2 \times 1.5 \times 10^{-4} = 0.6$ J/T

Torque $\tau = MB\sin 30°$

$= 0.6 \times 5 \times 10^{-2} \times \frac{1}{2} = 1.5 \times 10^{-2}$ N m

23. **(c)**

24. **(c)** : $iG = (I - i)S$ where G is the galvanometer resistance and S is the shunt used with the ammeter.

$1.0 \times 60 = (5 - 1)S$ where S is the shunt used to read a 5 A current when the galvanometer can stand by 1 A.

$S = \frac{1.0 \times 60}{4} = 15\ \Omega$ in parallel.

25. **(d)** :

Lorentz force $= q(\vec{v} \times \vec{B})$

$= (-2 \times 10^{-6})[(2\hat{i} + 3\hat{j}) \times 10^6 \times 2\hat{j}] = -8\hat{k}$ N.

$= 8$ N in $-z$ direction.

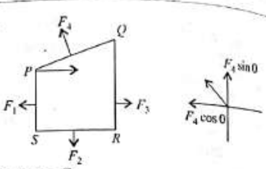
26. **(b)** : For the circular motion in a cyclotron,

$$qvB = \frac{mv^2}{r} \Rightarrow qB = m\omega = \frac{m \times 2\pi}{T}$$

$\therefore T = \frac{2\pi m}{qB}$ is independent of v and r.

27. **(a)** : When a charged particle having a given K.E, T enters in a field of magnetic induction, which is perpendicular to its velocity, it takes a circular trajectory. It does not increase in energy, therefore T is the K.E.

28. **(d)** :



$F_4\sin\theta = F_2$

$F_4\cos\theta = (F_3 - F_1)$

$\therefore F_4 = \sqrt{(F_3 - F_1)^2 + F_2^2}$

For a closed loop there is no translation.

29. **(b)** : Total initial resistance

$= R_G + R_1 = (50 + 2950)\ \Omega = 3000\ \Omega$

$\varepsilon = 3$ V

$\therefore$ Current $= \frac{3\text{ V}}{3000\ \Omega} = 1 \times 10^{-3}$ mA

If the deflection has to be reduced to 20 divisions, current $i = 1\text{ mA} \times \frac{2}{3}$ as the full deflection scale for 1 mA = 30 divisions.

$3\text{V} = 3000\ \Omega \times 1\text{ mA} = x\ \Omega \times \frac{2}{3}$ mA

$\Rightarrow x = 3000 \times 1 \times \frac{3}{2} = 4500\ \Omega$

But the galvanometer resistance = 50 Ω

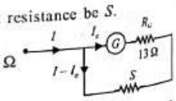
Therefore the resistance to be added

$= (4500 - 50)\Omega = 4450\ \Omega$.

30. **(a)** : Let the shunt resistance be S.

Given: $I = 750$ A,

$I_g = 100$ A, $R_G = 13\ \Omega$



From the figure,

$I_g R_G = (I - I_g)S$

or $100 \times 13 = [750 - 100]S$ or $1300 = 650S$

$\therefore S = 1300/650 = 2\ \Omega$.

31. **(d)** : Force acting on a charged particle moving with velocity $\vec{v}$ is subjected to magnetic field $\vec{B}$ is given by

$\vec{F} = q(\vec{v} \times \vec{B})$ or, $F = qvB\sin\theta$

(i) When $\theta = 0°$, $F = qvB\sin 0° = 0$

(ii) When $\theta = 90°$, $F = qvB\sin 90° = qvB$

iii) When $\theta = 180°$, $F = qvB\sin 180° = 0$

This implies force acting on a charged particle is non-zero, when angle between $\vec{v}$ and $\vec{B}$ can have any value other than zero and 180°.

32. **(c)** : Question is not correct.

The magnetic field at the centre of the coil,

$B = \frac{\mu_0 n i}{2r}$

where r is the radius. $E/R = i$.

$\therefore R \propto 2\pi r \Rightarrow R = cr$, where c is a constant.

$\therefore$ In the first coil,

$$B_1 = \frac{\mu_0 n i_1}{2r_1} = \frac{\mu_0 n E}{2r_1(cr_1)} = \frac{\mu_0 n E}{2cr_1^2}$$

If $r_1 = 2r_2$, $B_1 = \frac{\mu_0 n E_1}{2c(2r_2)^2} = \frac{\mu_0 n E_1}{2c \cdot 4r_2^2}$

$$B_2 = \frac{\mu_0 n E_2}{2cr_2^2}$$

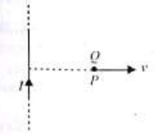
As B_1 will not be equal to B_2 unless E_1 is different from E_2, E_1 and E_2 will not be the same.

It is wrong to ask what potential difference should be applied across them. It should be perhaps the ratio of potential differences.

In that case, $B_1 = B_2$.

$\frac{E_1}{4} = E_2 \Rightarrow E_1 = 4E_2$. $\therefore \frac{E_1}{E_2} = 4$.

33. **(a)** : According to Fleming's left hand rule direction of force is along Oy axis which is perpendicular to wire.



$\vec{F} = e(\vec{v} \times \vec{B})$.

B due to i is acting inwards *i.e.* into the paper.

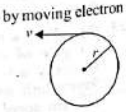
v is along Ox.

$$\therefore F = Q^+ \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ v & 0 & 0 \\ 0 & 0 & -B \end{vmatrix} \Rightarrow F = Q^+[-\hat{j}(-vB) + 0]$$

$\therefore \vec{F} = +QvB\,\hat{j}$.

i.e. in Oy direction.

34. **(c)** : The magnetic field produce by moving electron in circular path $B = \frac{\mu_0 i}{2r}$



where $i = \frac{q}{t} = \frac{q}{2\pi r} \times v$

$\therefore B = \frac{\mu_0 qv}{4\pi r^2} \Rightarrow r \propto \sqrt{\frac{v}{B}}$.

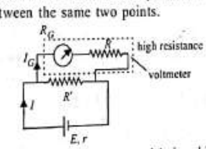
35. **(d)** : The total current shown by the galvanometer $= 25 \times 4 \times 10^{-4}$ A.

$I_g = 10^{-2}$ A.

The value of resistance connected in series to convert galvanometer into voltmeter of 25 V is

$$R = \frac{V}{I_g} - G = \frac{25}{10^{-2}} - 50 = 2450\ \Omega.$$

36. **(a)** : Voltmeter is used to measure the potential difference across a resistance and it is connected in parallel with the circuit. A high resistance is connected to the galvanometer in series so that only a small fraction (I_g) of the main circuit current (I) passes through it. If a considerable amount of current is allowed to pass through the voltmeter, then the reading obtained by this voltmeter will not be close to the actual potential difference between the same two points.



37. **(a)** : If a moving charged particle is subjected to a perpendicular uniform magnetic field, then according to $F = qvB\sin\theta$, it will experience a maximum force which will provide the centripetal force to particle and it will describe a circular path with uniform speed.

38. **(b)** : Magnetic field induction at point inside the solenoid of length l, having n turns per unit length carrying current i is given by

$B = \mu_0 ni$

If $i \rightarrow$ doubled, $n \rightarrow$ halved then $B \rightarrow$ remains same.

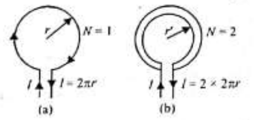
39. **(b)** : The force experienced by a charged particle moving in space where electric and magnetic field exists is called Lorentz force.

When a charged particle carrying charge q is subjected to an electric field of strength $\vec{E}$, it experiences a force given by $\vec{F}_e = q\vec{E}$ whose direction is same as $\vec{E}$ or opposite of $\vec{E}$ depending on the nature of charge, positive or negative.

If a charged particle is moving in a magnetic field of strength $\vec{B}$ with a velocity $\vec{v}$ it experiences a force given by $\vec{F}_m = q(\vec{v} \times \vec{B})$. The direction of this force is in the direction of $\vec{v} \times \vec{B}$ *i.e.* perpendicular to the plane containing $\vec{v}$ and $\vec{B}$ and is directed as given by right hand screw rule. Due to both the electric and magnetic fields, the total force experienced by the charge q is given by

$$\vec{F} = \vec{F}_e + \vec{F}_m = q\vec{E} + q(\vec{v} \times \vec{B}).$$

40. **(c)** : The magnetic field B produced at the centre of a circular coil due to current I flowing through this is given by $B = \frac{\mu_0 NI}{2r}$, N is number of turns and r is radius of the coil. Here $B = \frac{\mu_0 I}{2r}$ $[N = 1]$.



$\therefore$ $2 \times 2\pi r' = 2\pi r$ (same length). $\therefore$ $r' = r/2$.

$\therefore$ Magnetic field at the centre for two turns ($N = 2$) is given by

$$B' = \frac{\mu_0 \times 2I}{2r'} = \frac{\mu_0 \times 2I}{2r/2} = \frac{4\mu_0 I}{2r} = 4B.$$

41. **(a)** : Magnetic moment $M = niA$

42. **(c)** : The frequency of revolution of charged particle in a perpendicular magnetic field is

$$\upsilon = \frac{1}{T} = \frac{1}{2\pi r/v} = \frac{v}{2\pi r} = \frac{v}{2\pi} \times \frac{eB}{mv} = \frac{eB}{2\pi m}.$$

43. **(c)** : $B = \frac{\mu_0}{4\pi}\frac{2i_2}{(r/2)} - \frac{\mu_0}{4\pi}\frac{2i_1}{(r/2)} = \frac{\mu_0}{4\pi}\frac{4}{r}(i_2 - i_1)$

$$= \frac{\mu_0}{4\pi}\frac{4}{5}(2.5 - 5.0) = -\frac{\mu_0}{2\pi}.$$

–ve sign show that B is acting inwards *i.e.* into the plane.

44. **(a)** : $B = \frac{\mu_0 Ni}{2r} = \frac{4\pi \times 10^{-7} \times 1000 \times 0.1}{2 \times 0.1} = 6.28 \times 10^{-4}$ T

45. **(b)** : Diameter of first wire $(d_1) = 0.5$ mm; Current in first wire $(I_1) = 1$A; Diameter of second wire $(d_2) = 1$ mm and current in second wire $(I_2) = 1$A. Strength of magnetic field due to current flowing in a conductor, $(B) = \frac{\mu_0}{4\pi} \times \frac{2I}{a}$ or $B \propto I$.

Since the current in both the wires is same, therefore there is no change in the strength of the magnetic field.

46. **(b)** : Use Ampère's law

$\oint B.dl = \mu_0\, i_{\text{enclosed}}$.

Outside : $i_{\text{enclosed}} \neq 0$ (some value) $\Rightarrow B \neq 0$

Inside $= i_{\text{enclosed}} = 0 \Rightarrow B = 0$.

47. **(b)** : $B = \frac{\mu_0(Ni)}{2r} = \frac{4\pi \times 10^{-7} \times 50 \times 2}{2 \times 0.5} = 1.256 \times 10^{-4}$ T

48. **(d)** : $qvB\sin\theta = \frac{mv^2}{R}$

$$R = \frac{mv}{qB\sin\theta} = \frac{3 \times 10^5}{10^8 \times 0.3 \times \frac{1}{2}} = 2 \text{ cm}$$

49. **(c)** : $F = \frac{\mu_0}{4\pi}\frac{2I_1I_2}{r} = \frac{10^{-7} \times 2(1) \times (1)}{1} = 2 \times 10^{-7}$ N/m

50. **(b)** : The shunt and galvanometer are in parallel.

Therefore, $\frac{1}{R_{eq}} = \frac{1}{9} + \frac{1}{2}$ or, $R_{eq} = \frac{18}{11}\,\Omega$.

Using Ohm's law, $V = IR_{eq} = 1 \times \frac{18}{11} = \frac{18}{11}$ V.

$\therefore$ Current through shunt $= \frac{V}{R_s}$

$$= \frac{18/11}{2} = \frac{9}{11} \simeq 0.8 \text{ amp.}$$

51. **(b)** : Magnetic field at the centre of the coil, $B = \frac{\mu_0 N}{2\pi a}$

Let l be the length of the wire, then

$$B_1 = \frac{\mu_0}{2\pi} \cdot \frac{1 \times I}{l/2\pi} = \frac{\mu_0 I}{l}$$

and $B_2 = \frac{\mu_0}{2\pi} \cdot \frac{2 \times I}{l/4\pi} = \frac{4\mu_0 I}{l}$

Therefore, $\frac{B_1}{B_2} = \frac{1}{4}$ or, $B_1 : B_2 = 1 : 4$.

52. **(c)** : Distance between two parallel wires $(x) = 10$ cm $= 0.1$ m; Current in each wire $= I_1 = I_2 = 10$ A and length of wire $(l) = 1$ m.

Force on the wire $(F) = \frac{\mu_0 I_1 \cdot I_2 \times l}{2\pi x}$

$$= \frac{(4\pi \times 10^{-7}) \times 10 \times 10 \times 1}{2\pi \times 0.1} = 2 \times 10^{-4} \text{ N.}$$

Since the current is flowing in the same direction therefore the force will be attractive.

53. **(b)** : When a positively charged particle enters in a region of uniform magnetic field, directed vertically upwards, it experiences a centripetal force which will move it in circular path with a uniform speed.

54. **(b)**

55. **(b)** : The direction of the magnetic field, due to current, is given by the right-hand rule. At axis AB, the components of magnetic field will cancel each other and the resultant magnetic field will be zero.

56. **(b)** : According to Biot-Savart's law,

$$d\vec{B} \propto i\left(\frac{d\vec{l} \times \vec{r}}{r^3}\right) = \frac{\mu_0}{4\pi}i\left(\frac{d\vec{l} \times \vec{r}}{r^3}\right).$$

57. **(a)** : Kinetic energy of electron $\left(\frac{1}{2} \times mv^2\right) = 10$ eV and magnetic induction $(B) = 10^{-4}$ Wb/m^2.

Therefore $\frac{1}{2}(9.1 \times 10^{-31})v^2 = 10 \times (1.6 \times 10^{-19})$

or, $v^2 = \frac{2 \times 10 \times (1.6 \times 10^{-19})}{9.1 \times 10^{-31}} = 3.52 \times 10^{12}$

or, $v = 1.876 \times 10^6$ m.

Centripetal force $= \frac{mv^2}{r} = Bev$.

Therefore $r = \frac{mv}{Be} = \frac{(9.1 \times 10^{-31}) \times (1.876 \times 10^6)}{10^{-4} \times (1.6 \times 10^{-19})}$

$= 11 \times 10^{-2}$ m $= 11$ cm.

58. **(d)** : Electric field $(E) = 20$ V/m and magnetic field $(B) = 0.5$ T.

The force on electron in a magnetic field $= evB$

Force on electron on an electric field $= eE$

Since the electron is moving with constant velocity, therefore the resultant force on electron is zero.

i.e., $eE = evB \Rightarrow v = E/B = 20/0.5 = 40$ ms^{-1}

59. **(c)** : Area $(A) = 0.01$ m^2; Current $(I) = 10$ A; Angle $(\phi) = 90°$ and magnetic field $(B) = 0.1$ T.

Therefore acutal angle $\theta = (90° - \phi) = (90° - 90°) = 0°$.

And torque acting on the loop $(\tau) = IAB \sin\theta$

$= 10 \times 0.01 \times 0.1 \times \sin 0° = 0$.

60. **(a)** : The force acting on a charged particle in magnetic field is given by

$\vec{F} = q(\vec{v} \times \vec{B})$ or $F = qvB\sin\theta$

$\therefore F = 0$

when angle between v and B is 180°.

61. **(a)** : A current carrying coil has magnetic dipole moment. Hence a torque $p_m \times B$ acts on it in magnetic field.

62. **(a)** : To convert a galvanometer into ammeter, one needs to connect a low resistance in parallel so that maximum current passes through the shunt wire and ammeter remains protected.

63. **(b)** : $F = il \times B = 1.2 \times 0.5 \times 2 = 1.2$ N.

64. **(a)** : $B = \frac{\mu_0 i}{2\pi r}$ or $B \propto \frac{1}{r}$

When r is doubled, the magnetic field becomes halved *i.e.*,now the magnetic field will be 0.2 T.

65. **(c)** : $r = \frac{mv}{qB}$ or $r \propto v$

As v is doubled, the radius also becomes doubled. Hence radius $= 2 \times 2 = 4$ cm.

66. **(d)** : For a charged particle orbiting in a circular path in a magnetic field

$$\frac{mv^2}{r} = Bvq \Rightarrow v = \frac{Bqr}{m}$$

$$mv^2 = Bqvr$$

$$E_K = \frac{1}{2}mv^2 = \frac{1}{2}Bqvr = Bq\frac{r}{2} \cdot \frac{Bqr}{m} = \frac{B^2q^2r^2}{2m}$$

For deuteron, $E_1 = \frac{B^2q^2 \times r^2}{2 \times 2m}$

For proton, $E_2 = \frac{B^2q^2r^2}{2m}$

$$\frac{E_1}{E_2} = \frac{1}{2} \Rightarrow \frac{50 \text{ keV}}{E_2} = \frac{1}{2} \Rightarrow E_2 = 100 \text{ keV}$$

67. **(a)** : $B \propto 1/r$. By Ampère's law.

As the distance is increased to three times, the magnetic induction reduces to one third.

Hence $B = \frac{1}{3} \times 10^{-3}$ tesla $= 3.33 \times 10^{-4}$ tesla

68. **(d)** : When current flows in a coil, its electric field is perpendicular to the magnetic field always.

Therefore (a) and (b).

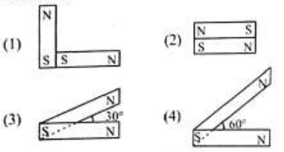
69. **(b)** : The plane of coil will orient itself so that area vector aligns itself along the magnetic field.

CHAPTER

15 Magnetism and Matter

1. A rectangular coil of length 0.12 m and width 0.1 m having 50 turns of wire is suspended vertically in a uniform magnetic field of strength 0.2 Weber/m^2. The coil carries a current of 2 A. If the plane of the coil is inclined at an angle of 30° with the direction of the field, the torque required to keep the coil in stable equilibrium will be
(a) 0.24 Nm (b) 0.12 Nm
(c) 0.15 Nm (d) 0.20 Nm
(AIPMT 2015)

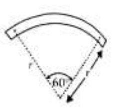
2. Following figures show the arrangement of bar magnets in different configurations. Each magnet has magnetic dipole moment $\vec{m}$. Which configuration has highest net magnetic dipole moment?



(a) (1) (b) (2)
(c) (3) (d) (4) *(AIPMT 2014)*

3. A current loop in a magnetic field
(a) can be in equilibrium in two orientations, both the equilibrium states are unstable.
(b) can be in equilibrium in two orientations, one stable while the other is unstable.
(c) experiences a torque whether the field is uniform or non uniform in all orientations.
(d) can be in equilibrium in one orientation.
(NEET 2013)

4. A bar magnet of length 'l' and magnetic dipole moment 'M' is bent in the form of an arc as shown in figure. The new magnetic dipole moment will be



(a) $\frac{2}{\pi}M$
(b) $\frac{M}{2}$
(c) M
(d) $\frac{3}{\pi}M$
(NEET 2013)

5. A bar magnet of magnetic moment M is placed at right angles to a magnetic induction B. If a force F is experienced by each pole of the magnet, the length of the magnet will be
(a) MB/F (b) BF/M
(c) MF/B (d) F/MB
(Karnataka NEET 2013)

6. A compass needle which is allowed to move in a horizontal plane is taken to a geomagnetic pole. It
(a) will become rigid showing no movement
(b) will stay in any position
(c) will stay in north-south direction only
(d) will stay in east-west direction only
(Prelims 2012)

7. A magnetic needle suspended parallel to a magnetic field requires $\sqrt{3}$ J of work to turn it through 60°. The torque needed to maintain the needle in this position will be
(a) $2\sqrt{3}$ J (b) 3 J
(c) $\sqrt{3}$ J (d) $\frac{3}{2}$ J *(Mains 2012)*

8. There are four light-weight-rod samples A, B, C, D separately suspended by threads. A bar magnet is slowly brought near each sample and the following observations are noted
(i) A is feebly repelled
(ii) B is feebly attracted
(iii) C is strongly attracted
(iv) D remains unaffected
Which one of the following is true?

(a) B is of a paramagnetic material
(b) C is of a diamagnetic material
(c) D is of a ferromagnetic material
(d) A is of a non-magnetic material
(Prelims 2011)

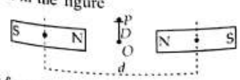
9. A short bar magnet of magnetic moment 0.4 J T^{-1} is placed in a uniform magnetic field of 0.16 T. The magnet is in stable equilibrium when the potential energy is
(a) 0.064 J (b) −0.064 J
(c) zero (d) −0.082 J
(Mains 2011)

10. Electromagnets are made of soft iron because soft iron has
(a) low retentivity and high coercive force
(b) high retentivity and high coercive force
(c) low retentivity and low coercive force
(d) high retentivity and low coercive force
(Prelims 2010)

11. A vibration magnetometer placed in magnetic meridian has a small bar magnet. The magnet executes oscillations with a time period of 2 sec in earth's horizontal magnetic field of 24 microtesla. When a horizontal field of 18 microtesla is produced opposite to the earth's field by placing a current carrying wire, the new time period of magnet will be
(a) 1 s (b) 2 s
(c) 3 s (d) 4 s *(Prelims 2010)*

12. The magnetic moment of a diamagnetic atom is
(a) much greater than one
(b) 1
(c) between zero and one
(d) equal to zero
(Mains 2010)

13. Two identical bar magnets are fixed with their centres at a distance d apart. A stationary charge Q is placed at P in between the gap of the two magnets at a distance D from the centre O as shown in the figure



The force on the charge Q is
(a) zero
(b) directed along OP
(c) directed along PO
(d) directed perpendicular to the plane of paper
(Mains 2010)

14. If a diamagnetic substance is brought near the north or the south pole of a bar magnet, it is
(a) repelled by the north pole and attracted by the south pole
(b) attracted by the north pole and repelled by the south pole
(c) attracted by both the poles
(d) repelled by both the poles *(Prelims 2009)*

15. A bar magnet having a magnetic moment of 2×10^4 J T^{-1} is free to rotate in a horizontal plane. A horizontal magnetic field $B = 6 \times 10^{-4}$ T exists in the space. The work done in taking the magnet slowly from a direction parallel to the field to a direction 60° from the field is
(a) 12 J (b) 6 J
(c) 2 J (d) 0.6 J
(Prelims 2009)

16. Curie temperature above which
(a) paramagnetic material becomes ferromagnetic material
(b) ferromagnetic material becomes diamagnetic material
(c) ferromagnetic material becomes paramagnetic material
(d) paramagnetic material becomes diamagnetic material
(Prelims 2008, 2006)

17. Nickel shows ferromagnetic property at room temperature. If the temperature is increased beyond Curie temperature, then it will show
(a) anti ferromagnetism
(b) no magnetic property
(c) diamagnetism
(d) paramagnetism.
(2007)

18. A charged particle (charge q) is moving in a circle of radius R with uniform speed v. The associated magnetic moment μ is given by
(a) qvR^2 (b) $qvR^2/2$
(c) qvR (d) $qvR/2$.
(2007)

19. If the magnetic dipole moment of an atom of diamagnetic material, paramagnetic material and ferromagnetic material are denoted by μ_d, μ_p and μ_f respectively, then
(a) $\mu_d = 0$ and $\mu_p \neq 0$
(b) $\mu_d \neq 0$ and $\mu_p = 0$
(c) $\mu_p = 0$ and $\mu_f \neq 0$
(d) $\mu_d \neq 0$ and $\mu_f \neq 0$.
(2005)

20. A coil in the shape of an equilateral triangle of side l is suspended between the pole pieces of a permanent magnet such that $\vec{B}$ is in plane of the coil. If due to a current i in the triangle a torque τ acts on it, the side l of the triangle is
(a) $\frac{2}{\sqrt{3}}\left(\frac{\tau}{Bi}\right)$
(b) $2\left(\frac{\tau}{\sqrt{3}Bi}\right)^{1/2}$
(c) $\frac{2}{\sqrt{3}}\left(\frac{\tau}{Bi}\right)^{1/2}$
(d) $\frac{1}{\sqrt{3}}\frac{\tau}{Bi}$ *(2005)*

21. A diamagnetic material in a magnetic field moves
(a) from stronger to the weaker parts of the field
(b) from weaker to the stronger parts of the field
(c) perpendicular to the field
(d) in none of the above directions *(2003)*

22. According to Curie's law, the magnetic susceptibility of a substance at an absolute temperature T is proportional to
(a) $1/T$
(b) T
(c) $1/T^2$
(d) T^2 *(2003)*

23. A bar magnet is oscillating in the Earth's magnetic field with a period T. What happens to its period and motion if its mass is quadrupled ?
(a) motion remains simple harmonic with time period = $T/2$
(b) motion remains S.H.M with time period = $2T$
(c) motion remains S.H.M with time period = $4T$
(d) motion remains S.H.M and period remains nearly constant *(2003, 1994)*

24. Two bar magnets having same geometry with magnetic moments M and $2M$, are firstly placed in such a way that their similar poles are same side then its time period of oscillation is T_1. Now the polarity of one of the magnet is reversed then time period of oscillation is T_2, then
(a) $T_1 < T_2$
(b) $T_1 = T_2$
(c) $T_1 > T_2$
(d) $T_2 = \infty$. *(2002)*

25. Among which the magnetic susceptibility does not depend on the temperature?
(a) diamagnetism
(b) paramagnetism
(c) ferromagnetism
(d) ferrite. *(2001)*

26. Tangent galvanometer is used to measure
(a) potential difference
(b) current
(c) resistance
(d) charge. *(2001)*

27. If a diamagnetic substance is brought near north or south pole of a bar magnet, it is
(a) repelled by north pole and attracted by the south pole
(b) repelled by the poles
(c) attracted by the poles
(d) attracted by the north pole and repelled by the south pole *(1999)*

28. A bar magnet of magnetic moment $\overrightarrow{M}$, is placed in a magnetic field of induction $\overrightarrow{B}$. The torque exerted on it is
(a) $\overrightarrow{M} \times \overrightarrow{B}$
(b) $-\overrightarrow{M} \cdot \overrightarrow{B}$
(c) $\overrightarrow{M} \cdot \overrightarrow{B}$
(d) $-\overrightarrow{B} \times \overrightarrow{M}$ *(1999)*

29. For protecting a sensitive equipment from the external magnetic field, it should be
(a) surrounded with fine copper sheet
(b) placed inside an iron can
(c) wrapped with insulation around it when passing current through it
(d) placed inside an aluminium can. *(1998)*

30. A bar magnet of magnetic moment M is cut into two parts of equal length. The magnetic moment of each part will be
(a) M
(b) $2M$
(c) zero
(d) $0.5\,M$. *(1997)*

31. The work done in turning a magnet of magnetic moment M by an angle of 90° from the meridian, is n times the corresponding work done to turn it through an angle of 60°. The value of n is given by
(a) 1/2
(b) 1/4
(c) 2
(d) 1. *(1995)*

Answer Key

1. (e)	2. (c)	3. (b)	4. (d)	5. (a)	6. (b)	7. (b)	8. (a)
9. (b)	10. (c)	11. (d)	12. (d)	13. (a)	14. (d)	15. (b)	16. (c)

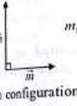
EXPLANATIONS

1. (d) : The required torque is
$\tau = NIAB\sin\theta$
where N is the number of turns in the coil, I is the current through the coil, B is the uniform magnetic field, A is the area of the coil and θ is the angle between the direction of the magnetic field and normal to the plane of the coil.
Here, $N = 50$, $I = 2$ A, $A = 0.12$ m × 0.1 m = 0.012 m²
$B = 0.2$ Wb/m² and $\theta = 90° - 30° = 60°$
$\therefore \tau = (50)(2\text{ A})(0.012\text{ m}^2)(0.2\text{ Wb/m}^2)\sin 60°$
$= 0.20$ Nm

2. (c) : The direction of magnetic dipole moment is from south to north pole of the magnet.
In configuration (1),

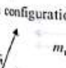


$$m_{net} = \sqrt{m^2 + m^2 + 2mm\cos 90°}$$
$$= \sqrt{m^2 + m^2} = 2\sqrt{m}$$

In configuration (2),

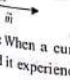
$$m_{net} = m - m = 0$$

In configuration (3),



$$m_{net} = \sqrt{m^2 + m^2 + 2mm\cos 30°}$$
$$= \sqrt{2m^2 + 2m^2\left(\frac{\sqrt{3}}{2}\right)} = m\sqrt{2+\sqrt{3}}$$

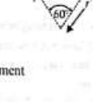
In configuration (4),



$$m_{net} = \sqrt{m^2 + m^2 + 2mm\cos 60°}$$
$$= \sqrt{2m^2 + 2m^2\left(\frac{1}{2}\right)} = m\sqrt{3}$$

3. (b) : When a current loop is placed in a magnetic field it experiences a torque. It is given by
$\vec{\tau} = \vec{M} \times \vec{B}$
where is the magnetic moment of the loop and is the magnetic field.
or $\tau = MB\sin\theta$ where θ is angle between M and B
When $\vec{M}$ and $\vec{B}$ are parallel (*i.e.* $\theta = 0°$) the equilibrium is stable and when they are antiparallel (*i.e.* $\theta = \pi$) the equilibrium is unstable.

4. (d) : Let m be strength of each pole of bar magnet of length l. Then
$M = m \times l$ ...(i)
When the bar magnet is bent in the form of an arc as shown in figure
Then



$l = \frac{\pi}{3} \times r = \frac{\pi r}{3}$
or $r = \frac{3l}{\pi}$
New magnetic dipole moment
$M' = m \times 2r\sin 30°$
$= m \times 2 \times \frac{3l}{\pi} \times \frac{1}{2} = \frac{3ml}{\pi} = \frac{3M}{\pi}$ (Using (i))

5. (a)

6. (b) : A compass needle which is allowed to move in a horizontal plane is taken to a geomagnetic pole. It will stay in any position as the horizontal component of earth's magnetic field becomes zero at the geomagnetic pole.

7. (b) : Work done in changing the orientation of a magnetic needle of magnetic moment M in a magnetic field B from position θ_1 to θ_2 is given by
$W = MB(\cos\theta_1 - \cos\theta_2)$
Here, $\theta_1 = 0°$, $\theta_2 = 60°$
$= MB\left(1 - \frac{1}{2}\right) = \frac{MB}{2}$ ...(i)
The torque on the needle is
$\vec{\tau} = \vec{M} \times \vec{B}$
In magnitude,
$\tau = MB\sin\theta = MB\sin 60° = \frac{\sqrt{3}}{2}MB$ ...(ii)
Dividing (ii) by (i), we get
$\frac{\tau}{W} = \sqrt{3}$
$\tau = \sqrt{3}W = \sqrt{3} \times \sqrt{3}\text{ J} = 3\text{ J}$

8. (a) : Diamagnetic will be feebly repelled.
Paramagnetic will be feebly attracted.
Ferromagnetic will be strongly attracted.

Therefore, A is of diamagnetic material. B is of paramagnetic material. C is of ferromagnetic material. D is of non-magnetic material.

9. **(b)** : Here, Magnetic moment, $M = 0.4\ \text{J T}^{-1}$
Magnetic field, $B = 0.16$ T
When a bar magnet of magnetic moment is placed in a uniform magnetic field, its potential energy is
$U = -\vec{M}\cdot\vec{B} = -MB\cos\theta$
For stable equilibrium, $\theta = 0°$
$\therefore\ U = -MB = -(0.4\ \text{J T}^{-1})(0.16\ \text{T}) = -0.064$ J

10. **(c)** : Electromagnets are made of soft iron because soft iron has low retentivity and low coercive force or low coercivity. Soft iron is a soft magnetic material.

11. **(d)** : The time period T of oscillation of a magnet is given by

$$T = 2\pi\sqrt{\frac{I}{MB}}$$

where,
I = Moment of inertia of the magnet about the axis of rotation
M = Magnetic moment of the magnet
B = Uniform magnetic field
As the I, B remains the same

$$\therefore\ T \propto \frac{1}{\sqrt{B}} \quad \text{or} \quad \frac{T_2}{T_1} = \sqrt{\frac{B_1}{B_2}}$$

According to given problem,

$B_1 = 24\ \mu\text{T}$
$B_2 = 24\ \mu\text{T} - 18\ \mu\text{T} = 6\ \mu\text{T}$
$T_1 = 2$ s

$$\therefore\ T_2 = (2\ \text{s})\sqrt{\frac{(24\ \mu\text{T})}{(6\ \mu\text{T})}} = 4\ \text{s}$$

12. **(d)** : The magnetic moment of a diamagnetic atom is equal to zero.

13. **(a)** : Magnetic field due to bar magnets exerts force on moving charges only. Since the charge is at rest, zero force acts on it.

14. **(d)** : A diamagnet is always repelled by a magnetic field. Therefore it is repelled by both the north pole as well as the south pole.

15. **(b)** : Here, $M = 2 \times 10^4\ \text{J T}^{-1}$
$B = 6 \times 10^{-4}$ T, $\theta_1 = 0°$, $\theta_2 = 60°$

$W = MB(\cos\theta_1 - \cos\theta_2) = MB(1 - \cos 60°)$

$W = 2 \times 10^4 \times 6 \times 10^{-4}\left(1 - \frac{1}{2}\right) = 6$ J.

16. **(c)** : At Curie temperature, there is a change from ferromagnetic to paramagentic behaviour. Above this temperature, the paramagentic substance obeys Curie Weiss law, even those resistances which are not ferromagnetic but only paramagnetic also obey Curie Weiss law above the Curie temperature only.

17. **(d)** : Above Curie temperature, ferromagnetic material become paramagnetic.

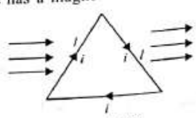
18. **(d)** : Magnetic moment $\mu = IA$

Since $T = \frac{2\pi R}{v}$ Also, $I = \frac{q}{T} = \frac{qv}{2\pi R}$

$$\therefore\ \mu = \left(\frac{qv}{2\pi R}\right)(\pi R^2) = \frac{qvR}{2}.$$

19. **(a)** : Materials with no unpaired, or isolated electrons are considered diamagnetic. Diamagnetic substances do not have magnetic dipole moments and have negative susceptibilities. However, materials having unpaired electrons whose spins do not cancel each other are called paramagnetic. These substances have positive magnetic moments and susceptibilities.
$\mu_d = 0,\ \mu_p \neq 0.$

20. **(b)** : The current flowing clockwise in the equilateral triangle has a magnetic field in the direction $\hat{k}$



$\tau = BiNA\sin\theta = B\ iA\sin 90°$

$\tau = Bi \times \frac{\sqrt{3}}{4}l^2$ (area of equilateral triangle $= \frac{\sqrt{3}}{4}l^2$)
(as it appears that $N = 1$)

$$\left(\frac{4\tau}{\sqrt{3}Bi}\right) = l^2 \Rightarrow l = 2\left(\frac{\tau}{Bi\sqrt{3}}\right)^{1/2}.$$

21. **(a)**

22. **(a)** : According to Curie's law $\chi \propto \frac{1}{T}$

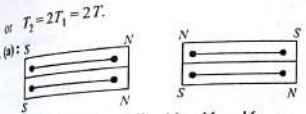
23. **(b)** : Initial mass of the magnet $(m_1) = m$ and final mass of the magnet $(m_2) = 4\ m$. The time period

$$(T) = 2\pi\sqrt{\frac{I}{MB}} = 2\pi\sqrt{\frac{mk^2}{MB}} \propto \sqrt{m}.$$

Therefore $\frac{T_1}{T_2} = \frac{\sqrt{m_1}}{\sqrt{m_2}} = \frac{\sqrt{m}}{\sqrt{4m}} = \frac{1}{2}$

or $T_2 = 2T_1 = 2T$.

24. **(a)** :



(i) $M = M_1 + M_2$
$I = I_1 + I_2$

(ii) $M = M_1 - M_2$
$I = I_1 + I_2$

(i) Similar poles are placed at the same side (sum position)
(ii) Opposite poles are placed at the same side (difference position)
I_1 and I_2 are the moments of inertia of the magnets and M_1 and M_2 are the moments of the magnets. Here $M_1 = M$ and $M_2 = 2M$, $I_1 = I_2 = I$ (say), for same geometry.

$$\therefore\ T_1 = 2\pi\sqrt{\frac{I_1 + I_2}{(M_1 + M_2)H}} = 2\pi\sqrt{\frac{2I}{(M + 2M)H}}$$

for same position.

$$\text{and } T_2 = 2\pi\sqrt{\frac{I_1 + I_2}{(M_2 - M_1)H}} = 2\pi\sqrt{\frac{2I}{(2M - M)H}}$$

for difference position.

$$\therefore\ \frac{T_1}{T_2} = \sqrt{\frac{M}{3M}} = \frac{1}{\sqrt{3}} < 1.\quad \therefore\ T_1 < T_2.$$

25. **(a)**

26. **(b)** : $I = K\tan\theta$

27. **(b)** 28. **(a, d)** 29. **(b)**

30. **(d)** : Magnetic moment = pole strength × length
$\therefore\ M' = M/2 = 0.5\ M.$

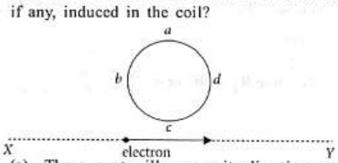
31. **(c)** : Angle of magnet $(\theta) = 90°$ and $60°$. Work done in turning the magnet through $90°$.
$(W_1) = MB(\cos 0° - \cos 90°) = MB(1 - 0) = MB.$
Similarly $W_2 = MB(\cos 0° - \cos 60°) = MB\left(1 - \frac{1}{2}\right)$
$= \frac{MB}{2}.$
Therefore $W_1 = 2W_2$ or $n = 2$.

CHAPTER

16 Electromagnetic Induction and Alternating Current

1. A series R-C circuit is connected to an alternating voltage source. Consider two situations :
(*a*) When capacitor is air filled.
(*b*) When capacitor is mica filled.
Current through resistor is i and voltage across capacitor is V then
(a) $i_a > i_b$ (b) $V_a = V_b$
(c) $V_a < V_b$ (d) $V_a > V_b$
(AIPMT 2015)

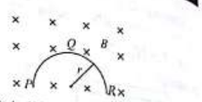
2. An electron moves on a straight line path XY as shown. The $abcd$ is a coil adjacent to the path of electron. What will be the direction of current, if any, induced in the coil?



(a) The current will reverse its direction as the electron goes past the coil
(b) No current induced
(c) *abcd* (d) *adcb*
(AIPMT 2015)

3. A resistance 'R' draws power 'P' when connected to an AC source. If an inductance is now placed in series with the resistance, such that the impedance of the circuit becomes 'Z', the power drawn will be
(a) $P\left(\frac{R}{Z}\right)$ (b) P
(c) $P\left(\frac{R}{Z}\right)^2$ (d) $P\sqrt{\frac{R}{Z}}$
(AIPMT 2015, Cancelled)

4. A thin semicircular conducting ring (PQR) of radius r is falling with its plane vertical in a horizontal magnetic field B, as shown in the figure.



The potential difference developed across the ring when its speed is v, is
(a) zero
(b) $\frac{Bv\pi r^2}{2}$ and P is at higher potential
(c) πrBv and R is at higher potential
(d) $2rBv$ and R is at higher potential
(AIPMT 2014)

5. A transformer having efficiency of 90% is working on 200 V and 3 kW power supply. If the current in the secondary coil is 6 A, the voltage across the secondary coil and the current in the primary coil respectively are
(a) 300 V, 15 A (b) 450 V, 15 A
(c) 450 V, 13.5 A (d) 600 V, 15 A
(AIPMT 2014)

6. A wire loop is rotated in a magnetic field. The frequency of change of direction of the induced e.m.f. is
(a) four times per revolution
(b) six times per revolution
(c) once per revolution
(d) twice per revolution *(NEET 2013)*

7. A coil of self-inductance L is connected in series with a bulb B and an AC source. Brightness of the bulb decreases when
(a) a capacitance of reactance $X_C = X_L$ is included in the same circuit.
(b) an iron rod is inserted in the coil.
(c) frequency of the AC source is decreased.
(d) number of turns in the coil is reduced.
(NEET 2013)

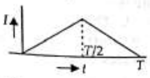
8. The primary of a transformer when connected to a dc battery of 10 Volt draws a current of 1 mA. The number of turns of the primary and secondary windings are 50 and 100 respectively. The voltage in the secondary and the current drawn by the circuit in the secondary are respectively
(a) 20 V and 2.0 mA
(b) 10 V and 0.5 mA
(c) Zero volt and therefore no current
(d) 20 V and 0.5 mA *(Karnataka NEET 2013)*

9. A current of 2.5 A flows through a coil of inductance 5 H. The magnetic flux linked with the coil is
(a) 0.5 Wb (b) 12.5 Wb
(c) zero (d) 2 Wb
(Karnataka NEET 2013)

10. A coil of resistance 400 Ω is placed in a magnetic field. If the magnetic flux ϕ (Wb) linked with the coil varies with time t (sec) as $\phi = 50t^2 + 4$.
The current in the coil at $t = 2$ sec is
(a) 0.5 A (b) 0.1 A (c) 2 A (d) 1 A
(Prelims 2012)

11. In an electrical circuit R, L, C and ac voltage source are all connected in series. When L is removed from the circuit, the phase difference between the voltage and the current in the circuit is If instead, C is removed from the circuit, the phase difference is again The power factor of the circuit is
(a) $\frac{1}{2}$ (b) $\frac{1}{\sqrt{2}}$
(c) 1 (d) $\frac{\sqrt{3}}{2}$
(Prelims 2012)

12. The current (I) in the inductance is varying with time according to the plot shown in figure.

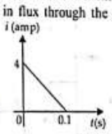


Which one of the following is the correct variation of voltage with time in the coil?

(a) 
(b) 
(c) 
(d) 
(Prelims 2012)

13. The instantaneous values of alternating current and voltages in a circuit are given as
$i = \frac{1}{\sqrt{2}}\sin(100\pi t)$ ampere
$e = \frac{1}{\sqrt{2}}\sin(100\pi t + \frac{\pi}{3})$ Volt
The average power in watts consumed in the circuit is
(a) $\frac{1}{4}$ (b) $\frac{\sqrt{3}}{4}$
(c) $\frac{1}{2}$ (d) $\frac{1}{8}$ *(Mains 2012)*

14. In a coil of resistance 10 Ω, the induced current developed by changing magnetic flux through it, is shown in figure as a function of time. The magnitude of change in flux through the coil in weber is
(a) 8
(b) 2
(c) 6
(d) 4

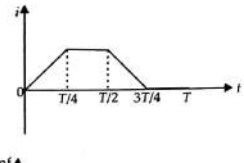


(Mains 2012)

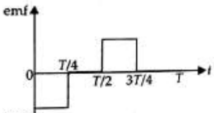
15. An ac voltage is applied to a resistance R and an inductor L in series. If R and the inductive reactance are both equal to 3 Ω, the phase difference between the applied voltage and the current in the circuit is
(a) $\pi/6$ (b) $\pi/4$
(c) $\pi/2$ (d) zero *(Prelims 2011)*

16. In an ac circuit an alternating voltage volts is connected to a capacitor of capacity 1 μF. The r.m.s. value of the current in the circuit is
(a) 10 mA (b) 100 mA
(c) 200 mA (d) 20 mA
(Prelims 2011)

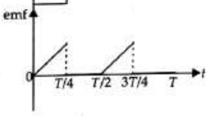
17. The current i in a coil varies with time as shown in the figure. The variation of induced emf with time would be



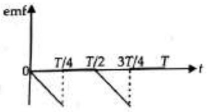
(a)



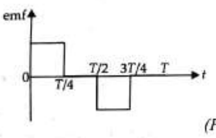
(b)



(c)

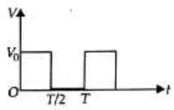


(d)



(Prelims 2011)

18. The r.m.s. value of potential difference V shown in the figure is



(a) $\frac{V_0}{\sqrt{3}}$
(b) V_0
(c) $\frac{V_0}{\sqrt{2}}$
(d) $\frac{V_0}{2}$ *(Mains 2011)*

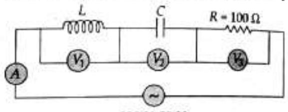
19. A coil has resistance 30 ohm and inductive reactance 20 ohm at 50 Hz frequency. If an ac source, of 200 volt, 100 Hz, is connected across the coil, the current in the coil will be

(a) 2.0 A (b) 4.0 A
(c) 8.0 A (d) $\frac{20}{\sqrt{13}}$ A *(Mains 2011)*

20. A conducting circular loop is placed in a uniform magnetic field, $B = 0.025$ T with its plane perpendicular to the loop. The radius of the loop is made to shrink at a constant rate of 1 mm s^{-1}. The induced emf when the radius is 2 cm, is

(a) $2\pi\,\mu V$ (b) $\pi\,\mu V$
(c) $\frac{\pi}{2}\mu V$ (d) $2\,\mu V$ *(Prelims 2010)*

21. In the given circuit the reading of voltmeter V_1 and V_2 are 300 volts each. The reading of the voltmeter V_3 and ammeter A are respectively



220 V, 50 Hz

(a) 150 V, 2.2 A (b) 220 V, 2.2 A
(c) 220 V, 2.0 A (d) 100 V, 2.0 A
(Prelims 2010)

22. A 220 volt input is supplied to a transformer. The output circuit draws a current of 2.0 ampere at 440 volts. If the efficiency of the transformer is 80%, the current drawn by the primary windings of the transformer is

(a) 3.6 ampere (b) 2.8 ampere
(c) 2.5 ampere (d) 5.0 ampere
(Prelims 2010)

23. A condenser of capacity C is charged to a potential difference of V_1. The plates of the condenser are then connected to an ideal inductor of inductance L. The current through the inductor when the potential difference across the condenser reduces to V_2 is

(a) $\left(\frac{C(V_1 - V_2)^2}{L}\right)^{\frac{1}{2}}$ (b) $\frac{C(V_1^2 - V_2^2)}{L}$
(c) $\frac{C(V_1^2 + V_2^2)}{L}$ (d) $\left(\frac{C(V_1^2 - V_2^2)}{L}\right)^{\frac{1}{2}}$
(Mains 2010)

24. A rectangular, a square, a circular and an elliptical loop, all in the $(x\text{-}y)$ plane, are moving out of a uniform magnetic field with a constant velocity, $\vec{V} = v\hat{i}$. The magnetic field is directed along the negative z axis direction. The induced emf, during the passage of these loops, out of the field region, will not remain constant for

(a) the circular and the elliptical loops
(b) only the elliptical loop
(c) any of the four loops
(d) the rectangular, circular and elliptical loops
(Prelims 2009)

25. Power dissipated in an LCR series circuit connected to an A.C. source of emf ε is

(a) $\frac{\varepsilon^2\sqrt{R^2 + \left(L\omega - \frac{1}{C\omega}\right)^2}}{R}$

(b) $\frac{\varepsilon^2\left[R^2 + \left(L\omega - \frac{1}{C\omega}\right)^2\right]}{R}$

(c) $\frac{\varepsilon^2 R}{\sqrt{R^2 + \left(L\omega - \frac{1}{C\omega}\right)^2}}$

(d) $\frac{\varepsilon^2 R}{\left[R^2 + \left(L\omega - \frac{1}{C\omega}\right)^2\right]}$ *(Prelims 2009)*

26. A conducting circular loop is placed in a uniform magnetic field 0.04 T with its plane perpendicular to the magnetic field. The radius of the loop starts shrinking at 2 mm/s. The induced emf in the loop when the radius is 2 cm is

(a) $4.8\pi\,\mu V$ (b) $0.8\pi\,\mu V$
(c) $1.6\pi\,\mu V$ (d) $3.2\pi\,\mu V$
(2009 Prelims)

27. A long solenoid has 500 turns. When a current of 2 ampere is passed through it, the resulting magnetic flux linked with each turn of the solenoid is 4×10^{-3} Wb. The self-inductance of the solenoid is

(a) 1.0 henry (b) 4.0 henry
(c) 2.5 henry (d) 2.0 henry
(Prelims 2008)

28. In an a.c. circuit the e.m.f. (ε) and the current (i) at any instant are given respectively by
$\varepsilon = E_0 \sin\omega t$, $i = I_0 \sin(\omega t - \phi)$
The average power in the circuit over one cycle of a.c. is

(a) $\frac{E_0 I_0}{2}\cos\phi$ (b) $E_0 I_0$
(c) $\frac{E_0 I_0}{2}$ (d) $\frac{E_0 I_0}{2}\sin\phi$
(Prelims 2008)

29. A circular disc of radius 0.2 meter is placed in a uniform magnetic field of induction $\frac{1}{\pi}\left(\frac{Wb}{m^2}\right)$ in such a way that its axis makes an angle of 60° with $\vec{B}$. The magnetic flux linked with the disc is

(a) 0.08 Wb (b) 0.01 Wb
(c) 0.02 Wb (d) 0.06 Wb
(Prelims 2008)

30. The primary and secondary coils of a transformer have 50 and 1500 turns respectively. If the magnetic flux ϕ linked with the primary coil is given by $\phi = \phi_0 + 4t$, where ϕ is in webers, t is time in seconds and ϕ_0 is a constant, the output voltage across the secondary coil is

(a) 120 volts (b) 220 volts
(c) 30 volts (d) 90 volts. *(2007)*

31. A transformer is used to light a 100 W and 110 V lamp from a 220 V mains. If the main current is 0.5 amp, the efficiency of the transformer is approximately

(a) 50% (b) 90%
(c) 10% (d) 30%. *(2007)*

32. What is the value of inductance L for which the current is maximum in a series LCR circuit with $C = 10\,\mu F$ and $\omega = 1000\,s^{-1}$?

(a) 1 mH
(b) cannot be calculated unless R is known
(c) 10 mH *(2007)*
(d) 100 mH.

33. A coil of inductive reactance 31 Ω has a resistance of 8 Ω. It is placed in series with a condenser of capacitative reactance 25 Ω. The combination is connected to an a.c. source of 110 V. The power factor of the circuit is

(a) 0.33 (b) 0.56
(c) 0.64 (d) 0.80 *(2006)*

34. Two coils of self inductance 2 mH and 8 mH are placed so close together that the effective flux in one coil is completely linked with the other. The mutual inductance between these coils is
(a) 16 mH (b) 10 mH
(c) 6 mH (d) 4 mH. *(2006)*

35. The core of a transformer is laminated because
(a) ratio of voltage in primary and secondary may be increased
(b) energy losses due to eddy currents may be minimised
(c) the weight of the transformer may be reduced
(d) rusting of the core may be prevented. *(2006)*

36. A transistor-oscillator using a resonant circuit with an inductor L (of negligible resistance) and a capacitor C in series produce oscillations of frequency f. If L is doubled and C is changed to $4C$, the frequency will be
(a) $f/2$ (b) $f/4$
(c) $8f$ (d) $f/2\sqrt{2}$ *(2006)*

37. In a circuit L, C and R are connected in series with an alternating voltage source of frequency f. The current leads the voltage by 45°. The value of C is
(a) $\frac{1}{\pi f(2\pi f L - R)}$ (b) $\frac{1}{2\pi f(2\pi f L - R)}$
(c) $\frac{1}{\pi f(2\pi f L + R)}$ (d) $\frac{1}{2\pi f(2\pi f L + R)}$ *(2005)*

38. As a result of change in the magnetic flux linked to the closed loop as shown in the figure, an e.m.f. V volt is induced in the loop.

The work done (joule) in taking a charge Q coulomb once along the loop is
(a) QV (b) $2QV$
(c) $QV/2$ (d) zero. *(2005)*

39. A coil of 40 henry inductance is connected in series with a resistance of 8 ohm and the combination is joined to the terminals of a 2 volt battery. The time constant of the circuit is
(a) 5 seconds (b) 1/5 seconds
(c) 40 seconds (d) 20 seconds *(2004)*

40. The magnetic flux through a circuit of resistance R changes by an amount $\Delta\phi$ in a time Δt. Then the total quantity of electric charge Q that passes any point in the circuit during the time Δt is represented by
(a) $Q = \frac{1}{R}\cdot\frac{\Delta\phi}{\Delta t}$ (b) $Q = \frac{\Delta\phi}{R}$
(c) $Q = \frac{\Delta\phi}{\Delta t}$ (d) $Q = R\cdot\frac{\Delta\phi}{\Delta t}$ *(2004)*

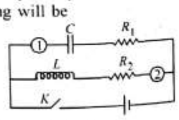
41. For a series LCR circuit the power loss at resonance is
(a) $\frac{V^2}{\left[\omega L - \frac{1}{\omega C}\right]}$ (b) $I^2 L\omega$
(c) $I^2 R$ (d) $\frac{V^2}{C\omega}$. *(2002)*

42. For a coil having $L = 2$ mH, current flow through it is $I = t^2e^{-t}$ then, the time at which emf become zero
(a) 2 sec (b) 1 sec
(c) 4 sec (d) 3 sec. *(2001)*

43. A capacitor of capacity C has reactance X. If capacitance and frequency become double then reactance will be
(a) $4X$ (b) $X/2$
(c) $X/4$ (d) $2X$. *(2001)*

44. The value of quality factor is
(a) $\frac{\omega L}{R}$ (b) $\frac{1}{\omega RC}$
(c) $\sqrt{LC}$ (d) L/R. *(2000)*

45. In the circuit given in figure, 1 and 2 are ammeters. Just after key K is pressed to complete the circuit, the reading will be



(a) zero in 1, maximum in 2
(b) maximum in both 1 and 2
(c) zero in both 1 and 2
(d) maximum in 1, zero in 2 *(1999)*

46. A step-up transformer operates on a 230 V line and supplies a load of 2 ampere. The ratio of the primary and secondary windings is 1 : 25. The current in the primary is

(a) 15 A (b) 50 A
(c) 25 A (d) 12.5 A *(1998)*

47. Two coils have a mutual inductance 0.005 H. The current changes in the first coil according to equation $I = I_0 \sin \omega t$, where $I_0 = 10$ A and $\omega = 100\pi$ rad/sec. The maximum value of e.m.f. in the second coil is
(a) π (b) 5π
(c) 2π (d) 4π *(1998)*

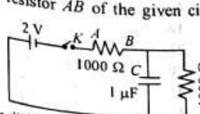
48. The primary winding of a transformer has 500 turns whereas its secondary has 5000 turns. The primary is connected to an A.C. supply 20 V, 50 Hz. The secondary will have an output of
(a) 2 V, 50 Hz (b) 2 V, 5 Hz
(c) 200 V, 50 Hz (d) 200 V, 500 Hz. *(1997)*

49. In an a.c. circuit with phase voltage V and current I, the power dissipated is
(a) $V.I$
(b) depends on phase angle between V and I
(c) $\frac{1}{2}\times V.I$ (d) $\frac{1}{\sqrt{2}}\times V.I$. *(1997)*

50. A metal ring is held horizontally and bar magnet is dropped through the ring with its length along the axis of the ring. The acceleration of the falling magnet is
(a) more than g (b) equal to g
(c) less than g (d) either (a) or (c). *(1996)*

51. In an A.C. circuit, the current flowing is $I = 5 \sin(100t - \pi/2)$ ampere and the potential difference is $V = 200 \sin(100t)$ volts. The power consumption is equal to
(a) 20 W (b) 0 W
(c) 1000 W (d) 40 W. *(1995)*

52. When the key K is pressed at time $t = 0$, then which of the following statement about the current I in the resistor AB of the given circuit is true?

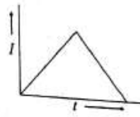


(a) I oscillates between 1 mA and 2 mA
(b) at $t = 0$, $I = 2$ mA and with time it goes to 1 mA
(c) $I = 1$ mA at all t
(d) $I = 2$ mA at all t.

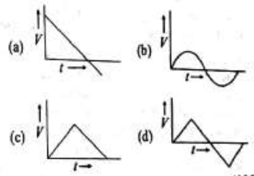
(1995)

53. A straight line conductor of length 0.4 m is moved with a speed of 7 m/s perpendicular to a magnetic field of intensity 0.9 Wb/m². The induced e.m.f. across the conductor is
(a) 5.04 V (b) 25.2 V
(c) 1.26 V (d) 2.52 V. *(1995)*

54. The current I in an A.C. circuit inductance coil varies with time according to the graph given below.



Which one of the following graphs gives the variation of voltage with time?



(1994)

55. In an A.C. circuit, I_{rms} and I_0 are related as
(a) $I_{rms} = \pi I_0$ (b) $I_{rms} = \sqrt{2}\, I_0$
(c) $I_{rms} = I_0/\pi$ (d) $I_{rms} = I_0/\sqrt{2}$. *(1994)*

56. An series L-C-R circuit is connected to a source of A.C. current. At resonance, the phase difference between the applied voltage and the current in the circuit, is
(a) π (b) zero
(c) $\pi/4$ (d) $\pi/2$. *(1994)*

57. Two cables of copper are of equal lengths. One of them has a single wire of area of cross-section A, while other has 10 wires of cross-sectional area $A/10$ each. Give their suitability for transporting A.C. and D.C.
(a) only multiple strands for A.C., either for D.C.
(b) only multiple strands for A.C., only single strand for D.C.

(c) only single strand for D.C., either for A.C.
(d) only single strand for A.C., either for D.C. *(1994)*

58. If N is the number of turns in a coil, the value of self inductance varies as
(a) N^0 (b) N
(c) N^2 (d) N^{-2} *(1993)*

59. What is the self-inductance of a coil which produces 5 mV when the current changes from 3 ampere to 2 ampere in one millisecond?
(a) 5000 henry (b) 5 mili-henry
(c) 50 henry (d) 5 henry *(1993)*

60. The time constant of C-R circuit is
(a) $1/CR$ (b) C/R
(c) CR (d) R/C *(1992)*

61. The total charge, induced in a conducting loop when it is moved in magnetic field depend on
(a) the rate of change of magnetic flux
(b) initial magnetic flux only
(c) the total change in magnetic flux
(d) final magnetic flux only *(1992)*

62. A rectangular coil of 20 turns and area of cross-section 25 sq. cm has a resistance of 100 Ω. If a magnetic field which is perpendicular to the plane of coil changes at a rate of 1000 tesla per second, the current in the coil is
(a) 1A (b) 50 A
(c) 0.5 A (d) 5 A *(1992)*

63. Faraday's laws are consequence of conservation of
(a) energy
(b) energy and magnetic field
(c) charge
(d) magnetic field *(1991)*

64. If the number of turns per unit length of a coil of solenoid is doubled, the self-inductance of the solenoid will
(a) remain unchanged (b) be halved
(c) be doubled (d) become four times *(1991)*

65. A 100 millihenry coil carries a current of 1A. Energy stored in its magnetic field is
(a) 0.5 J (b) 1 A
(c) 0.05 J (d) 0.1 J *(1991)*

66. A magnetic field of 2×10^{-2} T acts at right angles to a coil of area 100 cm^2, with 50 turns. The average e.m.f. induced in the coil is 0.1 V, when it is removed from the field in t sec. The value of t is
(a) 10 s (b) 0.1 s
(c) 0.01 s (d) 1 s *(1991)*

67. The current in self inductance L = 40 mH is to be increased uniformly from 1 amp to 11 amp in 4 milliseconds. The e.m.f. induced in inductor during process is
(a) 100 volt (b) 0.4 volt
(c) 4.0 volt (d) 440 volt *(1990)*

68. An inductor may store energy in
(a) its electric field (b) its coils
(c) its magnetic field
(d) both in electric and magnetic fields *(1990)*

69. In a region of magnetic induction $B = 10^{-2}$ tesla, a circular coil of radius 30 cm and resistance π^2 ohm is rotated about an axis which is perpendicular to the direction of B and which forms a diameter of the coil. If the coil rotates at 200 rpm the amplitude of the alternating current induced in the coil is
(a) $4\pi^2$ mA (b) 30 mA
(c) 6 mA (d) 200 mA *(1988)*

70. Eddy currents are produced when
(a) a metal is kept in varying magnetic field
(b) a metal is kept in steady magnetic field
(c) a circular coil is placed in a magnetic field
(d) through a circular coil, current is passed *(1988)*

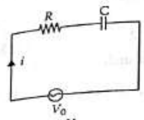
EXPLANATIONS

1. (d) : Current through resistor, i = Current in the circuit



$$= \frac{V_0}{\sqrt{R^2 + X_C^2}} = \frac{V_0}{\sqrt{R^2 + (1/\omega C)^2}}$$

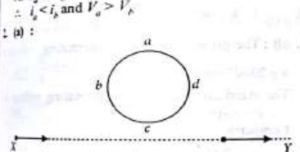
Voltage across capacitor, $V = iX_C$

$$= \frac{V_0}{\sqrt{R^2 + (1/\omega C)^2}} \times \frac{1}{\omega C}$$

$$= \frac{V_0}{\sqrt{R^2\omega^2 C^2 + 1}}$$

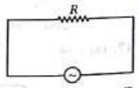
As $C_a < C_b$
$\therefore$ $i_a < i_b$ and $V_a > V_b$

2. (a) :



When the electron moves from X to Y, the flux linked with the coil $abcd$ (which is into the page) will first increase and then decrease as the electron passes by. So the induced current in the coil will be first anticlockwise and will reverse its direction (*i.e.* will become clockwise) as the electron goes past the coil.

3. (c) : Case I : $P = V_{rms} I_{rms}$



$$= V_{rms} \times \frac{V_{rms}}{R}$$

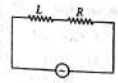
$$P = \frac{V_{rms}^2}{R} \Rightarrow V_{rms}^2 = PR \quad ...(i)$$

Case II : Power drawn in LR circuit

$$P' = V_{rms} I_{rms} \cos\phi = V_{rms} \times \frac{V_{rms}}{Z} \times \frac{R}{Z}$$

$$= V_{rms}^2 \frac{R}{Z^2} = PR \times \frac{R}{Z^2}$$

[Using eqn (i)]



$$P' = P\frac{R^2}{Z^2}$$

4. (d) : Motional emf induced in the semicircular ring PQR is equivalent to the motional emf induced in the imaginary conductor PR.
i.e., $\varepsilon_{PQR} = \varepsilon_{PR} = Bvl = Bv(2r)$ $\quad (l = PR = 2r)$
Therefore, potential difference developed across the ring is $2rBv$ with R is at higher potential.

5. (b) : Here,
Efficiency of the transformer, $\eta = 90\%$
Input power, $P_{in} = 3$ kW $= 3 \times 10^3$ W $= 3000$ W
Voltage across the primary coil, $V_p = 200$ V
Current in the secondary coil, $I_s = 6$ A
As $P_{in} = I_p V_p$
$\therefore$ Current in the primary coil,

$$I_p = \frac{P_{in}}{V_p} = \frac{3000 \text{ W}}{200 \text{ V}} = 15 \text{ A}$$

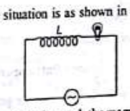
Efficiency of the transformer,

$$\eta = \frac{P_{out}}{P_{in}} = \frac{V_s I_s}{V_p I_p}$$

$$\therefore \frac{90}{100} = \frac{6V_s}{3000} \text{ or } V_s = \frac{90 \times 3000}{100 \times 6} = 450 \text{ V}$$

6. (d)

7. (b) : The situation is as shown in the figure.



As the iron rod is inserted, the magnetic field inside the coil magnetizes the iron increasing the magnetic field inside it. Hence, the inductance of the coil increases. Consequently, the inductive reactance of the coil increases. As a result, a larger fraction of the applied AC voltage appears across the inductor, leaving less voltage across the bulb. Therefore, the brightness of the light bulb decreases.

8. (c) : Transformer cannot work on dc.
$\therefore$ $V_s = 0$ and $I_s = 0$

9. **(b)** : Here, $I = 2.5$ A, $L = 5$ H
Magnetic flux linked with the coil is
$\phi_B = LI = (5\text{ H})(2.5\text{ A}) = 12.5$ Wb

10. **(a)** : Here, $\phi = 50t^2 + 4$ Wb, $R = 400\ \Omega$
Induced emf, $\varepsilon = -\frac{d\phi}{dt} = -\frac{d}{dt}(50t^2+4) = -100t$ V
At $t = 2$ s, $\varepsilon = -200$ V
$|\varepsilon| = 200$ V
Induced current in the coil at $t = 2$ s is
$$I = \frac{|\varepsilon|}{R} = \frac{200\text{ V}}{400\ \Omega} = \frac{1}{2}\text{ A} = 0.5\text{ A}$$

11. **(c)** : When L is removed, the phase difference between the voltage and current is
$$\tan\phi_1 = \frac{X_C}{R}$$
$$\tan\frac{\pi}{3} = \frac{X_C}{R} \text{ or } X_C = R\tan 60^\circ \text{ or } X_C = \sqrt{3}R$$
When C is removed, the phase difference between the voltage and current is
$$\tan\phi_2 = \frac{X_L}{R}$$
$$\tan\frac{\pi}{3} = \frac{X_L}{R} \text{ or } X_L = R\tan 60^\circ = \sqrt{3}R$$
As $X_L = X_C$, the series LCR circuit is in resonance.
Impedance of the circuit,
$$Z = \sqrt{R^2 + (X_L - X_C)^2} = R \qquad (\because X_L = X_C)$$
Power factor, $\cos\phi = \frac{R}{Z} = \frac{R}{R} = 1$

12. **(d)** : $V = -L\frac{dI}{dt}$
$V \propto$ slope of I-t graph

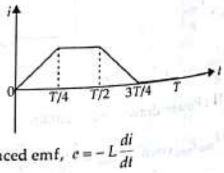
13. **(d)** : Given : $i = \frac{1}{\sqrt{2}}\sin(100\pi t)$ ampere
Compare it with $i = i_0\sin(\omega t)$, we get
$$i_0 = \frac{1}{\sqrt{2}}\text{ A}$$
Given : $e = \frac{1}{\sqrt{2}}\sin\left(100\pi t + \frac{\pi}{3}\right)$ volt
Compare it with , we get
$$e_0 = \frac{1}{\sqrt{2}}\text{ V}, \phi = \frac{\pi}{3}$$
$$\therefore\ i_{rms} = \frac{i_0}{\sqrt{2}} = \frac{\frac{1}{\sqrt{2}}}{\sqrt{2}}\text{ A} = \frac{1}{2}\text{ A}$$
$$e_{rms} = \frac{e_0}{\sqrt{2}} = \frac{\frac{1}{\sqrt{2}}}{\sqrt{2}}\text{ V} = \frac{1}{2}\text{ V}$$
Average power consumed in the circuit,
$$P = i_{rms}\,e_{rms}\cos\phi$$
$$= \left(\frac{1}{2}\right)\left(\frac{1}{2}\right)\cos\frac{\pi}{3} = \left(\frac{1}{2}\right)\left(\frac{1}{2}\right)\left(\frac{1}{2}\right) = \frac{1}{8}\text{ W}$$

14. **(b)** : q = Area under i-t graph
$$= \frac{1}{2}\times 4 \times 0.1 = 0.2\text{ C}$$
As $q = \frac{\Delta\phi}{R}$
$\therefore\ \Delta\phi = qR = (0.2\text{ C})(10\ \Omega) = 2$ weber

15. **(b)** : Here, $R = 3\ \Omega$
Inductive reactance, $X_L = 3\ \Omega$
Thephase difference between the applied voltage and the current in the circuit is
$$\tan\phi = \frac{X_L}{R} = \frac{3\ \Omega}{3\ \Omega} = 1$$
$$\phi = \tan^{-1}(1) \text{ or } \phi = \frac{\pi}{4}$$

16. **(d)** : The given equation of alternating voltage is
$e = 200\sqrt{2}\sin 100t$ ...(i)
The standard equation of alternating voltage is
$e = e_0\sin\omega t$ ...(ii)
Comparing (i) and (ii), we get
$$e_0 = 200\sqrt{2}\text{ V}, \omega = 100\text{ rad s}^{-1}$$
The capacitive reactance is
$$X_C = \frac{1}{\omega C} = \frac{1}{100\times 1\times 10^{-6}}\ \Omega$$
The r.m.s. value of the current in the circuit is
$$i_{r.m.s.} = \frac{v_{r.m.s.}}{X_C} = \frac{e_0/\sqrt{2}}{1/\omega C} = \frac{(200\sqrt{2}/\sqrt{2})}{(1/100\times 10^{-6})}$$
$$= 200\times 100\times 10^{-6}\text{ A} = 2\times 10^{-2}\text{ A} = 20\text{ mA}$$

17. **(a)** :



Induced emf, $e = -L\frac{di}{dt}$

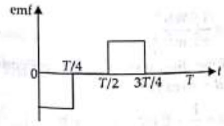
For $0 \le t \le \frac{T}{4}$,
i-t graph is a straight line with positive constant slope.
$\therefore\ \frac{di}{dt}$ = constant
$\Rightarrow\ e$ = –ve and constant For $0 \le t \le \frac{T}{4}$

For $\frac{T}{4} \le t \le \frac{T}{2}$
i is constant $\therefore\ \frac{di}{dt} = 0$
$\Rightarrow\ e = 0$ For $\frac{T}{4} \le t \le \frac{T}{2}$

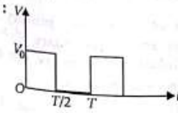
For $\frac{T}{2} \le t \le \frac{3T}{4}$
i-t graph is a straight line with negative constant slope.
$\therefore\ \frac{di}{dt}$ = constant
$\Rightarrow\ e$ = + ve and constant For $\frac{T}{2} \le t \le \frac{3T}{4}$

For $\frac{3T}{4} \le t \le T$,
i is zero $\therefore\ \frac{di}{dt} = 0$
$\Rightarrow\ e = 0$ For $\frac{3T}{4} \le t \le T$

From this analysis, the variation of induced emf with time as shown in the figure below.



18. **(c)** :



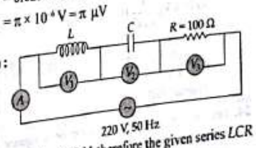
$V = V_0$ for $0 \le t \le \frac{T}{2}$
$V = 0$ for $\frac{T}{2} \le t \le T$

$$V_{rms} = \left[\frac{\int_0^T V^2 dt}{\int_0^T dt}\right]^{1/2} = \left[\frac{\int_0^{T/2} V_0^2 dt + \int_{T/2}^T (0)dt}{\int_0^T dt}\right]^{1/2}$$
$$= \left[\frac{V_0^2}{T}[t]_0^{T/2}\right]^{1/2} = \left[\frac{V_0^2}{T}\left(\frac{T}{2}\right)\right]^{1/2} = \left[\frac{V_0^2}{2}\right]^{1/2}$$
$$V_{rms} = \frac{V_0}{\sqrt{2}}$$

19. **(b)** : Here, Resistance, $R = 30\ \Omega$
Inductive reactance, $X_L = 20\ \Omega$ at 50 Hz
$\because\ X_L = 2\pi\upsilon L$
$$\therefore\ \frac{X_L}{X_L'} = \frac{\upsilon}{\upsilon'}$$
$$X_L' = \frac{\upsilon'}{\upsilon}\times X_L = \left(\frac{100}{50}\right)\times 20\ \Omega = 40\ \Omega$$
Impedance, $Z = \sqrt{R^2 + (X_L')^2} = \sqrt{(30)^2 + (40)^2}$
$= 50\ \Omega$
Current in the coil, $I = \frac{V}{Z} = \frac{200\text{ V}}{50\ \Omega} = 4$ A

20. **(b)** : Here,
Magnetic field, $B = 0.025$ T
Radius of the loop, $r = 2$ cm $= 2\times 10^{-2}$ m
Constant rate at which radius of the loop shrinks,
$$\frac{dr}{dt} = 1\times 10^{-3}\text{ m s}^{-1}$$
Magnetic flux linked with the loop is
$\phi = BA\cos 0 = B(\pi r^2)\cos 0^\circ = B\pi r^2$
The magnitude of the induced emf is
$$|\varepsilon| = \frac{d\phi}{dt} = \frac{d}{dt}(B\pi r^2) = B\pi 2r\frac{dr}{dt}$$
$$= 0.025\times\pi\times 2\times 2\times 10^{-2}\times 1\times 10^{-3}$$
$$= \pi\times 10^{-6}\text{ V} = \pi\ \mu\text{V}$$

21. **(b)** :



As $V_L = V_C = 300$ V, therefore the given series LCR circuit is in resonance.

$\therefore \quad V_R = V = 220\ \text{V}$

$Z = R = 100\ \Omega$

Current, $I = \frac{V}{Z} = \frac{220\ \text{V}}{100\ \Omega} = 2.2\ \text{A}$

Hence, the reading of the voltmeter V_3 is 220 V and the reading of ammeter A is 2.2 A.

22. **(d) :** Here,

Input voltage, $V_p = 220$ V

Output voltage, $V_s = 440$ V

Input current, $I_p = ?$

Output current, $I_s = 2$ A

Efficiency of the transformer, $\eta = 80\%$

Efficiency of the transformer, $\eta = \frac{\text{Output power}}{\text{Input power}}$

$$\eta = \frac{V_s I_s}{V_p I_p}$$

or $I_p = \frac{V_s I_s}{\eta V_p} = \frac{(440\ \text{V})(2\ \text{A})}{\left(\frac{80}{100}\right)(220\ \text{V})}$

$$= \frac{(440\ \text{V})(2\ \text{A})(100)}{(80)(220\ \text{V})} = 5\ \text{A}$$

23. **(d) :** In case of oscillatory discharge of a capacitor through an inductor, charge at instant t is given by

$q = q_0 \cos\omega t$

where, $\omega = \frac{1}{\sqrt{LC}}$ ...(i)

$\therefore \cos\omega t = \frac{q}{q_0} = \frac{CV_2}{CV_1} = \frac{V_2}{V_1} \quad (\because q = CV)$

Current through the inductor

$$I = \frac{dq}{dt} = \frac{d}{dt}(q_0 \cos\omega t) = -q_0\omega\sin\omega t$$

$$|I| = CV_1 \frac{1}{\sqrt{LC}}[1 - \cos^2\omega t]^{1/2}$$

$$= V_1\sqrt{\frac{C}{L}}\left[1 - \left(\frac{V_2}{V_1}\right)^2\right]^{1/2} = \left[\frac{C\left(V_1^2 - V_2^2\right)}{L}\right]^{1/2}$$

(using (i))

24. **(a) :** Once a rectangular loop or a square loop is being drawn out of the field, the rate of cutting the lines of field will be a constant for a square and rectangle, but not for circular or elliptical areas.

25. **(d) :** Average power, $P = E_{r.m.s} I_{r.m.s} \cos\phi$

$$Z = \sqrt{R^2 + (X_L - X_C)^2},\ \cos\phi = \frac{R}{Z}$$

But $I_{r.m.s} = \frac{E_{r.m.s}}{Z}$. $\therefore P = E_{r.m.s}^2 \cdot \frac{R}{Z^2}$

$$\therefore P = E_{r.m.s}^2 \frac{R}{\{R^2 + (X_L - X_C)^2\}} = \frac{\varepsilon^2 R}{\left[R^2 + \left(L\omega - \frac{1}{C\omega}\right)^2\right]}$$

26. **(d) :** Rate of decrease in the radius of the loop is 2 mm/s.

Final radius = 2 cm = 0.02 m

Initial radius = 2.2 cm = 0.022 m, $B = 0.04$ T

$$\varepsilon = -\frac{d\phi}{dt} = -B\frac{dA}{dt}$$

$\varepsilon = -\pi(0.022^2 - 0.02^2) \times 0.04 = -\pi \times 3.36 \times 10^{-6}$ V

$|\varepsilon| = \pi \times 3.36 \times 10^{-6}\ \text{V} = 3.4\pi\ \mu\text{V}$

27. **(a) :** For a long solenoid, $B = \mu_0 ni = \mu_0 \frac{N}{l} \cdot i$

$$\text{Flux} = \mu_0 \frac{N}{l} \cdot i \cdot A$$

given flux per turn $= 4 \times 10^{-3}$, $i = 2$ A

$\therefore$ Total flux $= 4 \times 10^{-3}$

$$L = \left(\mu_0 \frac{N}{l} \cdot NA\right) = \frac{4 \times 10^{-3} \times 500}{2} = 1\ \text{henry}$$

28. **(a) :** Average power $= \frac{E_0 I_0}{2}\cos\phi$

29. **(c) :** $\bar{B} = \frac{1}{\pi}\left(\frac{\text{Wb}}{\text{m}^2}\right)$

Area of the disc normal to B is $pR^2\cos 60°$.

Flux = B × Area normal

$\therefore$ Flux $= \frac{1}{2} \times 0.04 = 0.02$ Wb

30. **(a) :** Given : No. of turns across primary $N_p = 50$

Number of turns across secondary $N_s = 1500$

Magnetic flux linked with primary, $\phi = \phi_0 + 4t$

$\therefore$ Voltage across the primary,

$$V_p = \frac{d\phi}{dt} = \frac{d}{dt}(\phi_0 + 4t) = 4\ \text{volt.}$$

Also, $\frac{V_s}{V_p} = \frac{N_s}{N_p}$

$\therefore V_s = \left(\frac{1500}{50}\right) \times 4 = 120$ V.

31. **(b) :** Given : Output power $P = 100$ W

Voltage across primary $V_p = 220$ V

Current in the primary $I_p = 0.5$ A

Efficiency of a transformer $\eta = \frac{\text{output power}}{\text{input power}} \times 100$

$$= \frac{P}{V_p I_p} \times 100 = \frac{100}{220 \times 0.5} \times 100 = 90\%.$$

32. **(d) :** In series LCR, current is maximum at resonance.

$\therefore$ Resonant frequency $\omega = \frac{1}{\sqrt{LC}}$

$\therefore \omega^2 = \frac{1}{LC}$ or, $L = \frac{1}{\omega^2 C}$

Given $\omega = 1000\ \text{s}^{-1}$ and $C = 10\ \mu\text{F}$

$$\therefore L = \frac{1}{1000 \times 1000 \times 10 \times 10^{-6}} = 0.1\ \text{H} = 100\ \text{mH}.$$

33. **(d) :** $X_L = 31\ \Omega$, $X_C = 25\ \Omega$, $R = 8\ \Omega$

Impedence of series LCR is

$$Z = \sqrt{(R^2) + (X_L - X_C)^2}$$

$$= \sqrt{(8)^2 + (31 - 25)^2} = \sqrt{64 + 36} = 10\ \Omega.$$

Power factor, $\cos\phi = \frac{R}{Z} = \frac{8}{10} = 0.8$

34. **(d) :** Mutual inductance between coils is

$M = K\sqrt{L_1 L_2}$

or, $M = 1\sqrt{2 \times 10^{-3} \times 8 \times 10^{-3}} \quad (\because K = 1)$

$= 4 \times 10^{-3} = 4$ mH.

35. **(b) :** The core of a transformer is laminated to minimise the energy losses due to eddy currents.

36. **(d) :** Frequency of LC oscillation $= \frac{1}{2\pi\sqrt{LC}}$

or, $\frac{f_1}{f_2} = \left(\frac{L_2 C_2}{L_1 C_1}\right)^{1/2} = \left(\frac{2L \times 4C}{L \times C}\right)^{1/2} = (8)^{1/2}$

$\therefore \frac{f_1}{f_2} = 2\sqrt{2} \Rightarrow f_2 = \frac{f_1}{2\sqrt{2}}$ or, $f_2 = \frac{f}{2\sqrt{2}}$.

$(\because f_1 = f)$

37. **(d) :** $\tan\phi = \frac{X_C - X_L}{R}$

$$\tan\left(\frac{\pi}{4}\right) = \frac{\frac{1}{\omega C} - \omega L}{R}$$

$$R = \frac{1}{\omega C} - \omega L$$

$$(R + 2\pi fL) = \frac{1}{2\pi fC}$$

or $C = \frac{1}{2\pi f(R + 2\pi fL)}$

38. **(a) :** Work done due to a charge $W = QV$

39. **(a) :** Time constant of LR circuit is $\tau = L/R$.

$\therefore \tau = 5$ sec.

40. **(b) :** Induced emf is given by $\Rightarrow V = \frac{\Delta\phi}{\Delta t}$

$\Rightarrow$ current$(i) = \frac{Q}{\Delta t} = \frac{\Delta\phi}{\Delta t} \times \frac{1}{R}$

[where Q is total charge in time Δt]

$\Rightarrow Q = \frac{\Delta\phi}{R}$

41. **(c) :** The impedence Z of a series LCR circuit is given by, $Z = \sqrt{R^2 + (X_L - X_C)^2}$

where $X_L = \omega L$ and $X_C = \frac{1}{\omega C}$, ω is angular frequency.

At resonance, $X_L = X_C$, hence $Z = R$.

$\therefore V_R = V$ (supply voltage)

$\therefore$ R.M.S. current, $I = \frac{V_R}{R} = \frac{V}{R}$

$\therefore$ Power loss $= I^2 R = V^2/R$.

42. **(a) :** $I = t^2 e^{-t}$

$|\varepsilon| = L\frac{dI}{dt}$ here emf is zero when $\frac{dI}{dt} = 0$

$\frac{dI}{dt} = 2te^{-t} - t^2 e^{-t} = 0$; $2te^{-t} = t^2 e^{-t}$

i.e. $te^{-t}(t - 2) = 0 \Rightarrow t \neq \infty$ $t \neq 0$, $t = 2$ sec.

43. **(c) :** $X = \frac{1}{C\omega}$ $\quad X' = \frac{1}{4C\omega}$ $\quad \therefore X' = \frac{X}{4}$

44. **(a, b) :** Quality factor $Q = \frac{\omega L}{R}$

Since $\omega^2 = \frac{1}{LC}$

$\therefore$ Quality factor $Q = \frac{1}{\omega RC}$

45. **(d) :** At $t = 0$

(i) capacitor offers negligible resistance.

(ii) inductor offers large resistance to current flow.

46. **(b) :** $\frac{E_P}{E_S} = \frac{N_P}{N_S} = \frac{1}{25}$; $E_S = 5750$ V

$I_S = 2$ amp. $P_S = 2 \times 5750$

$$I_P = \frac{P_P}{V_P} = \frac{P_S}{V_P} = \frac{2 \times 5750}{230} = 50 \text{ A.}$$

47. (b) : As $|\varepsilon| = M\frac{dI}{dt} = M\frac{d}{dt}(I_0 \sin \omega t) = MI_0\omega \cos \omega t$

$\therefore \ \varepsilon_{max} = 0.005 \times 10 \times 100\pi \times 1 = 5\pi.$

48. (c) : Turns on primary winding = 500; Turns on secondary winding = 5000; Primary winding voltage (E_p) = 20 V and frequency = 50 Hz.

$$\frac{N_s}{N_p} = \frac{E_s}{E_p} \text{ or } \frac{5000}{500} = \frac{E_s}{20}$$

or $E_s = \frac{5000 \times 20}{500} = 200$ V and frequency remains the same. Therefore secondary winding will have an output of 200 V, 50 Hz.

49. (b) : The dissipation of power in an a.c. circuit is $(P) = V \times I \times \cos\theta$. Therefore current flowing in the circuit depends upon the phase voltage (V) and current (I) of the a.c. circuit.

50. (c) : When the magnet is dropped through the ring an induced current is developed into the ring in the direction opposing the motion of magnet (Lenz's law). Therefore this induced current decreases the acceleration of bar magnet.

51. (b) : Current (I) = $5 \sin(100t - \pi/2)$ and voltage (V) = $200 \sin(100\,t)$. Comparing the given equation, with the standard equation, we find that between current and voltage is $\phi = \frac{\pi}{2} = 90°$.

Power consumption $P = I_{rms}V_{rms}\cos\phi$

$= I_{rms}V_{rms}\cos 90° = 0$

52. (b) : Initially, the current will pass through the capacitor (and not through the resistance which is parallel to capacitor). So effective resistance in the circuit is R_{AB}. Therefore the current in the resistor is 2 mA. After some time, the capacitor will become fully charged and will be in its steady state. Now no current will pass through the capacitor and the effective resistance of the circuit will be (1000 + 1000) = 2000 Ω. Therefore current in the resistor

$$= \frac{V}{R} = \frac{2}{2000} = 1 \times 10^{-3}\text{ A} = 1 \text{ mA.}$$

53. (d) : Length of conductor (l) = 0.4 m;
Speed = 7 m/s and magnetic field (B) = 0.9 Wb/m^2.
Induced e.m.f. (ε) = Blv $= 0.9 \times 0.4 \times 7 = 2.52$ V.

54. (a) : In an A.C. circuit with inductance coil, the voltage V leads the current I by a phase difference of 90°. Or the current I lags behind the voltage by a phase difference of 90°. Thus the voltage is on decreasing with the increase in time as shown in the graph (a).

55. (d) : $I_{rms} = \frac{I_0}{\sqrt{2}}$

56. (b) : For resonance condition, the impedance will be minimum and the current be maximum. This is only possible when $X_L = X_C$.

Therefore $\tan\theta = \frac{X_L - X_C}{R} = 0$ or $\theta = 0$.

57. (a) : The major portion of the A.C. flows on the surface of the wire. So where a thick wire is required a number of thin wires are joined together to give an equivalent effect of a thick wire. Therefore multiple strands are suitable for transporting AC. Similarly multiple strands can also be used for DC.

58. (c) : $L = \frac{N\phi}{i}$; $\phi = BA$; $B = \mu_0 ni = \frac{\mu_0 Ni}{l}$

$$L = \frac{\mu_0 N^2}{l}A = \mu_0 n^2 Al$$

where n is the number of turns/unit length l = ...

59. (b) : $\varepsilon = -L\frac{di}{dt}$

$$L = \frac{-\varepsilon}{\frac{di}{dt}} = \frac{-5 \times 10^{-3}}{(2-3)}\text{ H} = 5 \text{ mH}$$

60. (c) : The time constant for resonance circuit $\tau = CR$

Growth of charge in a circuit containing capacitance and resistance is given by the formula $q = q_0(1 - e^{-t/CR})$

CR is known as time constant in this formula.

61. (c) : $q = \int i\,dt = \frac{1}{R}\int \varepsilon\,dt = \left(\frac{-d\phi}{dt}\right)\frac{1}{R}\int dt = \frac{1}{R}\int d\phi$

Hence total charge induced in the conducting loop depend upon the total change in magnetic flux. As the emf or iR depends on rate of change of flux charge induced depends on change of flux.

62. (c) : $i = \frac{\varepsilon}{R} = \frac{NA\frac{dB}{dt}}{R}$

$$= \frac{20 \times (25 \times 10^{-4}) \times 1000}{100} = 0.5\text{ A}$$

63. (d) : According to Faraday's laws, it is the conservation of energy.

64. (d) : Self inductance of a solenoid = $\mu_0 n^2 Al$
where n is the number of turns/length.
So self induction $\propto n^2$
So inductance becomes 4 times when n is doubled.

65. (c) : $E = \frac{1}{2}Li^2 = \frac{1}{2} \times (100 \times 10^{-3}) \times 1^2 = 0.05$ J

66. (b) : $\varepsilon = \frac{-(\phi_2 - \phi_1)}{t} = \frac{-(0 - NBA)}{t} = \frac{NBA}{t}$

$$t = \frac{NBA}{\varepsilon} = \frac{50 \times 2 \times 10^{-2} \times 10^{-2}}{0.1} = 0.1\text{ s}$$

67. (a) : $|\varepsilon| = L\frac{di}{dt}$

Given that, $L = 40 \times 10^{-3}$ H,

$di = 11\text{ A} - 1\text{ A} = 10\text{ A}$
and $dt = 4 \times 10^{-3}$ s

$\therefore |\varepsilon| = 40 \times 10^{-3} \times \left(\frac{10}{4 \times 10^{-3}}\right) = 100$ V

68. (c)

69. (c) : $I_0 = \frac{E_0}{R} = N\frac{BA\omega}{R}$

Given, $N = 1$, $B = 10^{-2}$ T,
$A = \pi(0.3)^2$ m^2, $R = \pi^2$
$f = (200/60)$ and $\omega = 2\pi(200/60)$

Substituting these values and solving, we get
$I_0 = 6 \times 10^{-3}$ A = 6 mA

70. (a) : Eddy currents are produced when a metal is kept in a varying magnetic field.

CHAPTER

17 Electromagnetic Waves

1. The energy of the em waves is of the order of 15 keV. To which part of the spectrum does it belong?
(a) Ultraviolet rays (b) γ-rays
(c) X-rays (d) Infra-red rays
(AIPMT 2015)

2. A radiation of energy 'E' falls normally on a perfectly reflecting surface. The momentum transferred to the surface is (C = Velocity of light)
(a) $\frac{2E}{C^2}$ (b) $\frac{E}{C^2}$
(c) $\frac{E}{C}$ (d) $\frac{2E}{C}$
(AIPMT 2015, Cancelled)

3. Light with an energy flux of 25×10^4 W m^{-2} falls on a perfectly reflecting surface at normal incidence. If the surface area is 15 cm^2, the average force exerted on the surface is
(a) 1.25×10^{-6} N (b) 2.50×10^{-6} N
(c) 1.20×10^{-6} N (d) 3.0×10^{-6} N
(AIPMT 2014)

4. The condition under which a microwave oven heats up a food item containing water molecules most efficiently is
(a) Microwaves are heat waves, so always produce heating.
(b) Infra-red waves produce heating in a microwave oven.
(c) The frequency of the microwaves must match the resonant frequency of the water molecules.
(d) The frequency of the microwaves has no relation with natural frequency of water molecules.
(NEET 2013)

5. An electromagnetic wave of frequency $\upsilon = 3.0$ MHz passes from vacuum into a dielectric medium with relative permittivity $\epsilon = 4.0$. Then
(a) Wavelength is doubled and frequency becomes half.
(b) Wavelength is halved and frequency remains unchanged.
(c) Wavelength and frequency both remain unchanged.
(d) Wavelength is doubled and frequency unchanged.
(Karnataka NEET 2013)

6. The electric field associated with an em wave in vacuum is given by $E = \hat{i}\, 40 \cos(kz - 6 \times 10^8 t)$ where E, z and t are in volt/m, meter and seconds respectively. The value of wave vector k is
(a) 2 m^{-1} (b) 0.5 m^{-1}
(c) 6 m^{-1} (d) 3 m^{-1}
(Prelims 2012)

7. The ratio of amplitude of magnetic field to the amplitude of electric field for an electromagnetic wave propagating in vacuum is equal to
(a) the speed of light in vacuum
(b) reciprocal of speed of light in vacuum
(c) the ratio of magnetic permeability to the electric susceptibility of vacuum
(d) unity
(Mains 2012)

8. The electric and the magnetic field, associated with an e.m. wave, propagating along the +z-axis, can be represented by
(a) $\left[\vec{E} = E_0\hat{i},\ \vec{B} = B_0\hat{j}\right]$
(b) $\left[\vec{E} = E_0\hat{k},\ \vec{B} = B_0\hat{i}\right]$
(c) $\left[\vec{E} = E_0\hat{j},\ \vec{B} = B_0\hat{i}\right]$
(d) $\left[\vec{E} = E_0\hat{j},\ \vec{B} = B_0\hat{k}\right]$
(Prelims 2011)

9. The decreasing order of wavelength of infrared, microwave, ultraviolet and gamma rays is
(a) microwave, infrared, ultraviolet, gamma rays
(b) gamma rays, ultraviolet, infrared, microwaves
(c) microwaves, gamma rays, infrared, ultraviolet
(d) infrared, microwave, ultraviolet, gamma rays
(Prelims 2011)

10. Which of the following statement is false for the properties of electromagnetic waves?
(a) Both electric and magnetic field vectors attain the maxima and minima at the same place and same time.
(b) The energy in electromagnetic wave is divided equally between electric and magnetic vectors.
(c) Both electric and magnetic field vectors are parallel to each other and perpendicular to the direction of propagation of wave.
(d) These waves do not require any material medium for propagation.
(Prelims 2010)

11. The electric field of an electromagnetic wave in free space is given by $\vec{E} = 10\cos(10^7 t + kx)\,\hat{j}$ V/m, where t and x are in seconds and metres respectively. It can be inferred that
(1) the wavelength λ is 188.4 m.
(2) the wave number k is 0.33 rad/m.
(3) the wave amplitude is 10 V/m.
(4) the wave is propagating along $+x$ direction.
Which one of the following pairs of statements is correct?
(a) (3) and (4) (b) (1) and (2)
(c) (2) and (3) (d) (1) and (3)
(Mains 2010)

12. The electric field part of an electromagnetic wave in a medium is represented by $E_x = 0$;
$E_y = 2.5 \frac{N}{C} \cos\left[\left(2\pi \times 10^6 \frac{rad}{m}\right)t - \left(\pi \times 10^{-2} \frac{rad}{s}\right)x\right]$;
$E_z = 0$. The wave is
(a) moving along x direction with frequency 10^6 Hz and wavelength 100 m.
(b) moving along x direction with frequency 10^6 Hz and wavelength 200 m.
(c) moving along $-x$ direction with frequency 10^6 Hz and wavelength 200 m.
(d) moving along y direction with frequency $2\pi \times 10^6$ Hz and wavelength 200 m.
(Prelims 2009)

13. The velocity of electromagnetic radiation in a medium of permittivity ε_0 and permeability μ_0 is given by
(a) $\frac{1}{\sqrt{\mu_0\varepsilon_0}}$ (b) $\sqrt{\frac{\mu_0}{\varepsilon_0}}$
(c) $\sqrt{\frac{\varepsilon_0}{\mu_0}}$ (d) $\sqrt{\mu_0\varepsilon_0}$
(Prelims 2008)

14. The electric and magnetic field of an electromagnetic wave are
(a) in opposite phase and perpendicular to each other
(b) in opposite phase and parallel to each other
(c) in phase and perpendicular to each other
(d) in phase and parallel to each other.
(2007, 1994)

15. If λ_v, λ_x and λ_m represent the wavelengths of visible light, X-rays and microwaves respectively, then
(a) $\lambda_m > \lambda_x > \lambda_v$ (b) $\lambda_m > \lambda_v > \lambda_x$
(c) $\lambda_v > \lambda_x > \lambda_m$ (d) $\lambda_v > \lambda_m > \lambda_x$.
(2005)

16. We consider the radiation emitted by the human body. Which one of the following statements is true ?
(a) The radiation emitted is in the infra-red region
(b) The radiation is emitted only during the day
(c) The radiation is emitted during the summers and absorbed during the winters
(d) The radiation emitted lies in the ultraviolet region and hence is not visible
(2003)

17. Which of the following rays are not electromagnetic waves ?
(a) X-rays (b) γ-rays
(c) β-rays (d) heat rays
(2003)

18. The velocity of electromagnetic wave is parallel to
(a) $\vec{B} \times \vec{E}$ (b) $\vec{E} \times \vec{B}$
(c) $\vec{E}$ (d) $\vec{B}$.
(2002)

19. What is the cause of Green house effect?
(a) infra-red rays (b) ultra violet rays
(c) X-rays (d) radio waves. *(2002)*

20. Biological importance of ozone layer is
(a) it stops ultraviolet rays
(b) ozone layer reduces green house effect
(c) ozone layer reflects radio waves
(d) ozone layer controls O_2/H_2 ratio in atmosphere. *(2001)*

21. The frequency order for γ-rays (B), X-rays (A), UV rays (C) is
(a) $B > A > C$ (b) $A > B > C$
(c) $C > B > A$ (d) $A > C > B$. *(2000)*

22. Ozone layer blocks the radiations of wavelength
(a) more than 3×10^{-7} m
(b) equal to 3×10^{-7} m
(c) less than 3×10^{-7} m
(d) all of these *(1999)*

23. Wavelength of light of frequency 100 Hz
(a) 4×10^{6} m (b) 3×10^{6} m
(c) 2×10^{6} m (d) 5×10^{-5} m *(1999)*

24. If ε_0 and μ_0 are the electric permittivity and magnetic permeability in a free space, ε and μ are the corresponding quantities in medium, the index and refraction of the medium is
(a) $\sqrt{\frac{\varepsilon_0\mu_0}{\varepsilon\mu}}$ (b) $\sqrt{\frac{\varepsilon\mu}{\varepsilon_0\mu_0}}$
(c) $\sqrt{\frac{\varepsilon_0\mu}{\varepsilon\mu_0}}$ (d) $\sqrt{\frac{\varepsilon}{\varepsilon_0}}$. *(1997)*

25. Which of the following electromagnetic radiations have the smaller wavelength?
(a) X-rays (b) γ-rays
(c) UV waves (d) microwaves. *(1994)*

26. A signal emitted by an antenna from a certain point can be received at another point of the surface in the form of
(a) sky wave (b) ground wave
(c) sea wave (d) both (a) and (b) *(1993)*

27. The structure of solids is investigated by using
(a) cosmic rays (b) X-rays
(c) γ-rays (d) infra-red radiations *(1992)*

28. The frequency of electromagnetic wave, which best suited to observe a particle of radius 3×10^{-4} cm is of the order of
(a) 10^{15} (b) 10^{14}
(c) 10^{13} (d) 10^{12} *(1991)*

29. In which of the following, emission of electrons does not take place
(a) thermionic emission
(b) X-rays emission
(c) photoelectric emission
(d) secondary emission *(1990)*

30. Which of the following electromagnetic radiations have the longest wavelength ?
(a) X-rays (b) γ-rays
(c) Microwaves (d) Radiowaves *(1989)*

EXPLANATIONS

1. (c) : As $\lambda = \frac{hc}{E}$
where the symbols have their usual meanings.
Here, $E = 15$ keV $= 15 \times 10^3$ V
and $hc = 1240$ eV nm
$\therefore \lambda = \frac{1240 \text{ eV nm}}{15 \times 10^3 \text{ eV}} = 0.083$ nm
As the wavelength range of X-rays is from 1 nm to 10^{-3} nm, so this wavelength belongs to X-rays.

2. (d) : Energy of radiation, $E = h\upsilon = \frac{hC}{\lambda}$
Also, its momentum $p = \frac{h}{\lambda} = \frac{E}{C} = p_i$
$p_r = -p_i = -\frac{E}{C}$
So, momentum transferred to the surface
$= p_i - p_r = \frac{E}{C} - \left(-\frac{E}{C}\right) = \frac{2E}{C}$

3. (b) : Here,
Energy flux, $I = 25 \times 10^4$ W m^{-2}
Area, $A = 15$ cm^2 $= 15 \times 10^{-4}$ m^2
Speed of light, $c = 3 \times 10^8$ m s^{-1}
For a perfectly reflecting surface, the average force exerted on the surface is
$$F = \frac{2IA}{c} = \frac{2 \times 25 \times 10^4 \text{ W m}^{-2} \times 15 \times 10^{-4} \text{ m}^2}{3 \times 10^8 \text{ m s}^{-1}}$$
$= 250 \times 10^{-8}$ N $= 2.50 \times 10^{-6}$ N

4. (c) : In microwave oven the frequency of the microwaves must match the resonant frequency of water molecules so that energy from the waves is transferred efficiently to the kinetic energy of the molecules.

5. (b) : Frequency of electromagnetic wave does not change with change in medium but wavelength and velocity of wave changes with change in medium.
Velocity of electromagnetic wave in vacuum
$$c = \frac{1}{\sqrt{\mu_0 \epsilon_0}} = \upsilon\lambda_{\text{vacuum}} \quad ...(i)$$
Velocity of electromagnetic wave in the medium
$$v_{\text{medium}} = \frac{1}{\sqrt{\mu_0\mu_r\epsilon_0\epsilon_r}} = \frac{c}{\sqrt{\mu_r\epsilon_r}}$$
where μ_r and ϵ_r be relative permeability and relative permittivity of the medium.
For dielectric medium, $\mu_r = 1$
$\therefore v_{\text{medium}} = \frac{c}{\sqrt{\epsilon_r}}$
Here, $\epsilon_r = 4.0$
$\therefore v_{\text{medium}} = \frac{c}{\sqrt{4}} = \frac{c}{2} \quad ...(ii)$
Wavelength of the wave in medium
$\lambda_{\text{medium}} = \frac{v_{\text{medium}}}{\upsilon} = \frac{c}{2\upsilon} = \frac{\lambda_{\text{vacuum}}}{2}$ (Using (i) and (ii))

6. (a) : Compare the given equation with
$E = E_0\cos(kz - \omega t)$
we get, $\omega = 6 \times 10^8$ s^{-1}
Wave vector, $k = \frac{\omega}{c} = \frac{6 \times 10^8 \text{ s}^{-1}}{3 \times 10^8 \text{ m s}^{-1}} = 2 \text{ m}^{-1}$

7. (b) : The amplitude of magnetic field and electric field for an electromagnetic wave propagating in vacuum are related as
$E_0 = B_0 c$
where c is the speed of light in vacuum.
$\therefore \frac{B_0}{E_0} = \frac{1}{c}$

8. (a) : The electromagnetic wave is propagating along the $+z$ axis.
Since the electric and magnetic fields are perpendicular to each other and also perpendicular to the direction of propagation of wave.
Also, $\vec{E} \times \vec{B}$ gives the direction of wave propagation. $(\because \hat{i} \times \hat{j} = \hat{k})$
$\therefore \vec{E} = E_0\hat{i},\ B = B_0\hat{j}$

9. (a) : The decreasing order of wavelength of the given electromagnetic waves is as follows :
$\lambda_{\text{Microwave}} > \lambda_{\text{Infrared}} > \lambda_{\text{Ultraviolet}} > \lambda_{\text{Gamma rays}}$

10. (c) : In an electromagnetic wave both electric and magnetic vectors are perpendicular to each other as well as perpendicular to the direction of propagation of wave.

11. (d) : As given

$$E = 10\cos(10^7 t + kx) \quad \text{...(i)}$$

Comparing it with standard equation of e.m. wave,

$$E = E_0\cos(\omega t + kx) \quad \text{...(ii)}$$

Amplitude $E_0 = 10$ V/m and $\omega = 10^7$ rad/s

$\because\ c = \upsilon\lambda = \dfrac{\omega\lambda}{2\pi}$

or $\lambda = \dfrac{2\pi c}{\omega} = \dfrac{2\pi \times 3\times 10^8}{10^7} = 188.4$ m

Also, $c = \dfrac{\omega}{k}$ or $k = \dfrac{\omega}{c} = \dfrac{10^7}{3\times 10^8} = 0.033$

The wave is propagating along y direction.

12. (b) :

$$E_y = 2.5\frac{\text{N}}{\text{C}}\left[\left(2\pi\times 10^6\ \frac{\text{rad}}{\text{m}}\right)t - \left(\pi\times 10^{-2}\ \frac{\text{rad}}{\text{s}}\right)x\right]$$

$E_z = 0$

The wave is moving in the positive direction of x.

This is the form $E_y = E_0(\omega t - kx)$

$\omega = 2\pi\times 10^6$

$2\pi\upsilon = 2\pi\times 10^6 \Rightarrow \upsilon = 10^6$ Hz

$\dfrac{2\pi}{\lambda} = k \Rightarrow \dfrac{2\pi}{\lambda} = \pi\times 10^{-2}$

$\Rightarrow \lambda = \dfrac{2\pi}{\pi\times 10^{-2}} = 2\times 10^2 = 200$ m.

13. (a) : The velocity of electromagnetic radiation in vacuum is $\dfrac{1}{\sqrt{\mu_0\varepsilon_0}}$, where μ_0 and ε_0 are the permeability and permittivity of vacuum.

14. (c) : In electromagnetic wave, electric and magnetic field are in phase and perpendicular to each other and also perpendicular to the direction of the propagation of the wave.

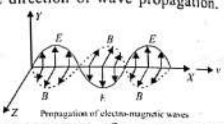
15. (b) : $\lambda_m > \lambda_v > \lambda_x$.

In spectrum X-rays has minimum wavelength and microwave has maximum wavelength.

16. (a) : Every body at all time, at all temperatures emit radiation (except at $T = 0$), which fall in the infrared region.

17. (c)

18. (b) : According to Maxwell, the electromagnetic waves are those waves in which there are sinusoidal variation of electric and magnetic field vectors at right angles to each other as well as at right angles to the direction of wave propagation.



Propagation of electro-magnetic waves

If the electric field ($\vec{E}$) and magnetic field ($\vec{B}$) are vibrating along Y and Z direction, propagation of electromagnetic wave will be along the X-axis. Therefore, the velocity of electromagnetic wave is parallel to $\vec{E}\times\vec{B}$.

19. (a) : As the electro-magnetic radiations from Sun pass through the atmosphere, some of them are absorbed by it while other reach the surface of earth. The range of wavelength which reaches earth lies in infrared region. This part of the radiation from the sun has shorter wavelength and can penetrate through the layer of gases like CO_2 and reach earth surface. But the radiation from the earth being of longer wavelength can escape through this layer. As a result the earth surface gets warm. This is known as green house effect.

20. (a) : The ozone layer absorbs the harmful ultraviolet rays coming from sun.

21. (a)

22. (d) : The range is from 380 nm to even 200 nm to 120 nm

23. (b) : $\lambda = \dfrac{3\times 10^8}{100\ \text{Hz}} = 3\times 10^6$ m

24. (b) : $c = \dfrac{1}{\sqrt{\mu_0\varepsilon_0}}$ (free space)

$v = \dfrac{1}{\sqrt{\mu\varepsilon}}$ (medium) $\quad\therefore\quad \mu = \dfrac{c}{v} = \sqrt{\dfrac{\mu\varepsilon}{\mu_0\varepsilon_0}}$

25. (b) **26. (d)**

27. (b) : X-rays are used for the investigation of structure of solids.

28. (b) : The wave length of radiation used should be less than the size of the particle

Size of particle $= \lambda = \dfrac{c}{\upsilon}$

$3\times 10^{-4} = \dfrac{3\times 10^{10}}{\upsilon}$ or $\upsilon = 10^{14}$ hertz

However, when frequency is higher than this, wavelength is still smaller. Resolution becomes better.

29. (b) : Thermionic emission : When a metal is heated to a high temperature, the free electron gain kinetic energy and escape from the surface of the metal.

Secondary emission : When an electron strikes the surface of a metallic plate, it emits other electrons from the surface.

Photoelectric emission : Emission of electrons from the metal surface on irradiation with radiation of suitable frequency.

X-rays emission : They are due to transitions in the inner energy levels of the atom.

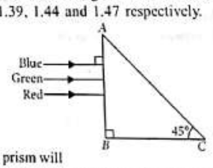
30. (d) :

Rays	Wave length [Range in m]
X-rays	1×10^{-11} to 3×10^{-8}
γ-rays	6×10^{-14} to 1×10^{-11}
Microwaves	10^{-3} to 0.3
Radiowaves	10 to 10^4

CHAPTER

18 Optics

1. A beam of light consisting of red, green and blue colours is incident on a right angled prism. The refractive index of the material of the prism for the above red, green and blue wavelengths are 1.39, 1.44 and 1.47 respectively.



The prism will
(a) not separate the three colours at all
(b) separate the red colour part from the green and blue colours
(c) separate the blue colour part from the red and green colours
(d) separate all the three colours from one another

(AIPMT 2015)

2. At the first minimum adjacent to the central maximum of a single-slit diffraction pattern, the phase difference between the Huygen's wavelet from the edge of the slit and the wavelet from the midpoint of the slit is

(a) π radian (b) $\frac{\pi}{8}$ radian
(c) $\frac{\pi}{4}$ radian (d) $\frac{\pi}{2}$ radian

(AIPMT 2015)

3. In an astronomical telescope in normal adjustment a straight black line of length L is drawn on inside part of objective lens. The eye-piece forms a real image of this line. The length of this image is I.
The magnification of the telescope is

(a) $\frac{L+I}{L-I}$ (b) $\frac{L}{I}$
(c) $\frac{L}{I}+1$ (d) $\frac{L}{I}-1$

(AIPMT 2015)

4. Two slits in Young's experiment have widths in the ratio 1 : 25. The ratio of intensity at the maxima and minima in the interference pattern, $\frac{I_{max}}{I_{min}}$ is

(a) $\frac{49}{121}$ (b) $\frac{4}{9}$
(c) $\frac{9}{4}$ (d) $\frac{121}{49}$

(AIPMT 2015)

5. For a parallel beam of monochromatic light of wavelength 'λ', diffraction is produced by a single slit whose width 'a' is of the order of the wavelength of the light. If 'D' is the distance of the screen from the slit, the width of the central maxima will be

(a) $\frac{Da}{\lambda}$ (b) $\frac{2Da}{\lambda}$
(c) $\frac{2D\lambda}{a}$ (d) $\frac{D\lambda}{a}$

(AIPMT 2015, Cancelled)

6. Two identical thin plano-convex glass lenses (refractive index 1.5) each having radius of curvature of 20 cm are placed with their convex surfaces in contact at the centre. The intervening space is filled with oil of refractive index 1.7. The focal length of the combination is

(a) −50 cm (b) 50 cm
(c) −20 cm (d) −25 cm

(AIPMT 2015, Cancelled)

7. The refracting angle of a prism is A, and refractive index of the material of the prism is cot (A/2). The angle of minimum deviation is

(a) 90° − A (b) 180° + 2A
(c) 180° − 3A (d) 180° − 2A

(AIPMT 2015, Cancelled)

8. In a double slit experiment, the two slits are 1 mm apart and the screen is placed 1 m away. A monochromatic light of wavelength 500 nm is used. What will be the width of each slit for obtaining ten maxima of double slit within the central maxima of single slit pattern?

(a) 0.5 mm (b) 0.02 mm
(c) 0.2 mm (d) 0.1 mm

(AIPMT 2015, Cancelled)

9. A beam of light of λ = 600 nm from a distant source falls on a single slit 1 mm wide and the resulting diffraction pattern is observed on a screen 2 m away. The distance between first dark fringes on either side of the central bright fringe is

(a) 1.2 cm (b) 1.2 mm
(c) 2.4 cm (d) 2.4 mm

(AIPMT 2014)

10. In the Young's double slit experiment, the intensity of light at a point on the screen where the path difference λ is K. (λ being the wavelength of light used). The intensity at a point where the path difference is λ/4 will be

(a) K (b) K/4
(c) K/2 (d) zero

(AIPMT 2014)

11. If the focal length of objective lens is increased then magnifying power of
(a) microscope will increase but that of telescope decrease.
(b) microscope and telescope both will increase.
(c) microscope and telescope both will decrease.
(d) microscope will decrease but that of telescope will increase.

(AIPMT 2014)

12. The angle of a prism is A. One of its refracting surfaces is silvered. Light rays falling at an angle of incidence 2A on the first surface returns back through the same path after suffering reflection at the silvered surface. The refractive index μ, of the prism is

(a) 2sin$A$ (b) 2cos$A$
(c) $\frac{1}{2}$cos A (d) tan$A$

(AIPMT 2014)

13. A plano convex lens fits exactly into a plano concave lens. Their plane surfaces are parallel to each other. If lenses are made of different materials of refractive indices μ_1 and μ_2 and R is the radius of curvature of the curved surface of the lenses, then the focal length of the combination is

(a) $\frac{R}{(\mu_1-\mu_2)}$ (b) $\frac{2R}{(\mu_2-\mu_1)}$
(c) $\frac{R}{2(\mu_1+\mu_2)}$ (d) $\frac{R}{2(\mu_1-\mu_2)}$

(NEET 2013)

14. In Young's double slit experiment, the slits are 2 mm apart and are illuminated by photons of two wavelengths λ_1 = 12000 Å and λ_2 = 10000 Å. At what minimum distance from the common central bright fringe on the screen 2 m from the slit will a bright fringe from one interference pattern coincide with a bright fringe from the other?

(a) 4 mm (b) 3 m
(c) 8 mm (d) 6 mm

(NEET 2013)

15. For a normal eye, the cornea of eye provides a converging power of 40 D and the least converging power of the eye lens behind the cornea is 20 D. Using this information, the distance between the retina and the cornea-eye lens can be estimated to be

(a) 1.67 cm (b) 1.5 cm
(c) 5 cm (d) 2.5 cm

(NEET 2013)

16. A parallel beam of fast moving electrons is incident normally on a narrow slit. A fluorescent screen is placed at a large distance from the slit. If the speed of the electrons is increased, which of the following statements is correct?
(a) The angular width of the central maximum will decrease.
(b) The angular width of the central maximum will be unaffected.
(c) Diffraction pattern is not observed on the screen in the case of electrons.
(d) The angular width of the central maximum of the diffraction pattern will increase.

(NEET 2013)

17. In Young's double slit experiment the distance between the slits and the screen is doubled. The separation between the slits is reduced to half. As a result the fringe width

38. The frequency of a light wave in a material is 2×10^{14} Hz and wavelength is 5000 Å. The refractive index of material will be
(a) 1.50 (b) 3.00
(c) 1.33 (d) 1.40 *(2007)*

39. A microscope is focussed on a mark on a piece of paper and then a slab of glass of thickness 3 cm and refractive index 1.5 is placed over the mark. How should the microscope be moved to get the mark in focus again?
(a) 2 cm upward
(b) 1 cm upward
(c) 4.5 cm downward
(d) 1 cm downward. *(2006)*

40. A convex lens and a concave lens, each having same focal length of 25 cm, are put in contact to form a combination of lenses. The power in diopters of the combination is
(a) zero (b) 25
(c) 50 (d) infinite. *(2006)*

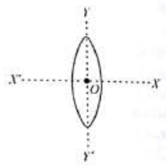
41. The angular resolution of a 10 cm diameter telescope at a wavelength of 5000 Å is of the order of
(a) 10^6 rad (b) 10^{-2} rad
(c) 10^{-4} rad (d) 10^{-6} rad. *(2005)*

42. A telescope has an objective lens of 10 cm diameter and is situated at a distance of one kilometre from two objects. The minimum distance between these two objects, which can be resolved by the telescope, when the mean wavelength of light is 5000 Å, is of the order of
(a) 0.5 m (b) 5 m
(c) 5 mm (d) 5 cm *(2004)*

43. The refractive index of the material of a prism is $\sqrt{2}$ and its refracting angle is 30°. One of the refracting surfaces of the prism is made a mirror inwards. A beam of monochromatic light entering the prism from the other face will retrace its path after reflection from the mirrored surface if its angle of incidence on the prism is
(a) 45° (b) 60°
(c) 0 (d) 30° *(2004)*

44. A beam of light composed of red and green ray is incident obliquely at a point on the face of rectangular glass slab. When coming out on the opposite parallel face, the red and green ray emerge from
(a) Two points propagating in two different non parallel directions
(b) Two points propagating in two different parallel directions.
(c) One point propagating in two different directions.
(d) One point propagating in the same directions. *(2004)*

45. An equiconvex lens is cut into two halves along (i) XOX' and (ii) YOY' as shown in the figure. Let f, f', f'' be the focal lengths of the complete lens, of each half in case (i), and of each half in case (ii), respectively.
Choose the correct statement from the following



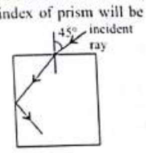
(a) $f' = f, f'' = 2f$ (b) $f' = 2f, f'' = f$
(c) $f' = f, f'' = f$ (d) $f' = 2f, f'' = 2f$ *(2003)*

46. A convex lens is dipped in a liquid whose refractive index is equal to the refractive index of the lens. Then its focal length will
(a) become zero
(b) become infinite
(c) become small, but non-zero
(d) remain unchanged *(2003)*

47. A bulb is located on a wall. Its image is to be obtained on a parallel wall with the help of convex lens. The lens is placed at a distance d ahead of second wall, then required focal length will be
(a) only $\frac{d}{4}$
(b) only $\frac{d}{2}$
(c) more than $\frac{d}{4}$ but less than $\frac{d}{2}$ *(2002)*
(d) less than $\frac{d}{4}$.

48. Diameter of human eye lens is 2 mm. What will be the minimum distance between two points to resolve them, which are situated at a distance of 50 meter from eye. The wavelength of light is 5000 Å
(a) 2.32 m (b) 4.28 mm
(c) 1.25 cm (d) 12.48 cm. *(2002)*

49. For the given incident ray as shown in figure, the condition of total internal refraction of this ray the required refractive index of prism will be



(a) $\frac{\sqrt{3}+1}{2}$
(b) $\frac{\sqrt{2}+1}{2}$
(c) $\sqrt{\frac{3}{2}}$
(d) $\sqrt{\frac{7}{6}}$. *(2002)*

50. Optical fibre are based on
(a) total internal reflection
(b) less scattering (c) refraction
(d) less absorption coefficient. *(2001)*

51. A ray of light travelling in air have wavelength λ, frequency n, velocity v and intensity I. If this ray enters into water then these parameters are λ', n', v' and I' respectively. Which relation is correct from following?
(a) $\lambda = \lambda'$ (b) $n = n'$
(c) $v = v'$ (d) $I = I'$. *(2001)*

52. A disc is placed on a surface of pond which has refractive index 5/3. A source of light is placed 4 m below the surface of liquid. The minimum radius of disc needed so that light is not coming out is,
(a) ∞ (b) 3 m
(c) 6 m (d) 4 m. *(2001)*

53. A bubble in glass slab ($\mu = 1.5$) when viewed from one side appears at 5 cm and 2 cm from other side, then thickness of slab is
(a) 3.75 cm (b) 3 cm
(c) 10.5 cm (d) 2.5 cm. *(2000)*

54. A tall man of height 6 feet, want to see his full image. Then required minimum length of the mirror will be
(a) 12 feet (b) 3 feet
(c) 6 feet (d) any length. *(2000)*

55. For a plano convex lens ($\mu = 1.5$) has radius of curvature 10 cm. It is silvered on its plane surface. Find focal length after silvering
(a) 10 cm (b) 20 cm
(c) 15 cm (d) 25 cm. *(2000)*

56. Rainbow is formed due to
(a) scattering and refraction
(b) internal reflection and dispersion
(c) reflection only
(d) diffraction and dispersion. *(2000)*

57. A plano convex lens is made of refractive index 1.6. The radius of curvature of the curved surface is 60 cm. The focal length of the lens is
(a) 200 cm (b) 100 cm
(c) 50 cm (d) 400 cm *(1999)*

58. Colours appear on a thin soap film and on soap bubbles due to the phenomenon of
(a) interference (b) dispersion
(c) refraction (d) diffraction *(1999)*

59. If the refractive index of a material of equilateral prism is $\sqrt{3}$, then angle of minimum deviation of the prism is
(a) 60° (b) 45°
(c) 30° (d) 75° *(1999)*

60. A luminous object is placed at a distance of 30 cm from the convex lens of focal length 20 cm. On the other side of the lens, at what distance from the lens a convex mirror of radius of curvature 10 cm be placed in order to have an upright image of the object coincident with it?
(a) 50 cm (b) 30 cm
(c) 12 cm (d) 60 cm *(1998)*

61. Light enters at an angle of incidence in a transparent rod of refractive index n. For what value of the refractive index of the material of the rod the light once entered into it will not leave it through its lateral face whatsoever be the value of angle of incidence?
(a) $n = 1.1$ (b) $n = 1$
(c) $n > \sqrt{2}$ (d) $n = 1.3$ *(1998)*

62. An astronomical telescope of tenfold angular magnification has a length of 44 cm. The focal length of the objective is
(a) 44 cm (b) 440 cm
(c) 4 cm (d) 40 cm. *(1997)*

Scanned by CamScanner

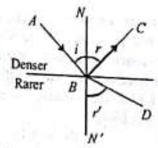
63. The focal length of converging lens is measured for violet, green and red colours. It is respectively f_v, f_g, f_r. We will get
(a) $f_v < f_r$
(b) $f_g > f_r$
(c) $f_v = f_g$
(d) $f_g > f_r$ (1997)

64. An electromagnetic radiation of frequency n, wavelength λ, travelling with velocity v in air, enters a glass slab of refractive index μ. The frequency, wavelength and velocity of light in the glass slab will be respectively
(a) n, 2λ and $\frac{v}{\mu}$
(b) $\frac{2n}{\mu}$, $\frac{\lambda}{\mu}$ and v
(c) $\frac{n}{\mu}$, $\frac{\lambda}{\mu}$ and $\frac{v}{\mu}$
(d) n, $\frac{\lambda}{\mu}$ and $\frac{v}{\mu}$. (1997)

65. If a convex lens of focal length 80 cm and a concave lens of focal length 50 cm are combined together, what will be their resulting power?
(a) + 7.5 D
(b) – 0.75 D
(c) + 6.5 D
(d) – 6.5 D. (1996)

66. The refractive index of water is 1.33. What will be the speed of light in water?
(a) 4×10^8 m/s
(b) 1.33×10^8 m/s
(c) 3×10^8 m/s
(d) 2.25×10^8 m/s. (1996)

67. A ray of light from a denser medium strikes a rare medium as shown in figure. The reflected and refracted rays make an angle of 90° with each other. The angles of reflection and refraction are r and r'. The critical angle would be



(a) $\sin^{-1}(\tan r)$
(b) $\sin^{-1}(\sin r)$
(c) $\cos^{-1}(\tan r)$
(d) $\tan^{-1}(\sin r)$ (1996)

68. If f_V and f_R are the focal lengths of a convex lens for violet and red light respectively and F_V and F_R are the focal lengths of a concave lens for violet and red light respectively, then we must have
(a) $f_V > f_R$ and $F_V > F_R$
(b) $f_V < f_R$ and $F_V > F_R$
(c) $f_V > f_R$ and $F_V < F_R$
(d) $f_V < f_R$ and $F_V < F_R$. (1996)

69. Light travels through a glass plate of thickness t and having a refractive index μ. If c is the velocity of light in vacuum, the time taken by light to travel this thickness of glass is
(a) $\frac{t}{\mu c}$
(b) $\frac{\mu t}{c}$
(c) $t\mu c$
(d) $\frac{tc}{\mu}$. (1996)

70. A lens is placed between a source of light and a wall. It forms images of area A_1 and A_2 on the wall, for its two different positions. The area of the source of light is
(a) $\frac{A_1 - A_2}{2}$
(b) $\frac{1}{A_1} + \frac{1}{A_2}$
(c) $\sqrt{A_1 A_2}$
(d) $\frac{A_1 + A_2}{2}$. (1995)

71. Exposure time of camera lens at $f/2.8$ setting is 1/200 second. The correct time of exposure at $f/5.6$ is
(a) 0.20 second
(b) 0.40 second
(c) 0.02 second
(d) 0.04 second. (1995)

72. In a Fresnel biprism experiment, the two positions of lens give separation between the slits as 16 cm and 9 cm respectively. What is the actual distance of separation?
(a) 13 cm
(b) 14 cm
(c) 12.5 cm
(d) 12 cm. (1995)

73. Four lenses of focal length ±15 cm and ± 150 cm are available for making a telescope. To produce the largest magnification, the focal length of the eyepiece should be
(a) + 15 cm
(b) + 150 cm
(c) – 150 cm
(d) – 15 cm. (1994)

74. The blue colour of the sky is due to the phenomenon of
(a) scattering
(b) dispersion
(c) reflection
(d) refraction. (1994)

75. Ray optics is valid, when characteristic dimensions are

(a) much smaller than the wavelength of light
(b) of the same order as the wavelength of light
(c) of the order of one millimetre
(d) much larger than the wavelength of light. (1994, 89)

76. A small source of light is 4 m below the surface of water of refractive index 5/3. In order to cut off all the light, coming out of water surface, minimum diameter of the disc placed on the surface of water is
(a) 6 m
(b) ∞
(c) 3 m
(d) 4 m. (1994)

77. A parallel beam of monochromatic light of wavelength 5000 Å is incident normally on a single narrow slit of width 0.001 mm. The light is focussed by a convex lens on a screen placed in focal plane. The first minimum will be formed for the angle of diffraction equal to
(a) 0°
(b) 15°
(c) 30°
(d) 50° (1993)

78. Interference was observed in interference chamber where air was present, now the chamber is evacuated, and if the same light is used, a careful observer will see
(a) no interference
(b) interference with brighter bands
(c) interference with dark bands
(d) interference with larger width (1993)

79. Time taken by sunlight to pass through a window of thickness 4 mm whose refractive index is $\frac{3}{2}$ is
(a) 2×10^{-4} s
(b) 2×10^{8} s
(c) 2×10^{-11} s
(d) 2×10^{11} s (1993)

80. There is a prism with refractive index equal to $\sqrt{2}$ and the refractive angle equal to 30°. One of the refractive surface of the prism is polished. A beam of monochromatic light will be retrace its path if its angle of indence over the refracting surface of the prism is
(a) 0°
(b) 30°
(c) 45°
(d) 60° (1992)

81. If yellow light emitted by sodium lamp in Young's double slit expt is replaced by monochromatic blue of light of the same intensity
(a) fringe width will decrease
(b) fringe width will increase
(c) fringe width will remain unchanged
(d) fringes will becomes less intense (1992)

82. In Young's double slit experiment carried out with light of wavelength $(\lambda) = 5000$ Å, the distance between the slits is 0.2 mm and the screen is at 200 cm from the slits. The central maximum is at $x = 0$. The third maximum (taking the central maximum as zeroth maximum) will be at x equal to
(a) 1.67 cm
(b) 1.5 cm
(c) 0.5 cm
(d) 5.0 cm (1992)

83. A beam of monochromatic light is refracted from vacuum into a medium of refractive index 1.5. The wavelength of refracted light will be
(a) depend on intensity of refracted light
(b) same
(c) smaller
(d) larger (1992, 91)

84. Green light wavelength 5460 Å is incident on an air-glass interface. If the refractive index of glass is 1.5, the wavelength of light in glass would be ($c = 3 \times 10^8$ ms^{-1})
(a) 3640 Å
(b) 5460 Å
(c) 4861 Å
(d) none of these (1991)

85. Ratio of intensities of two waves are given by 4 : 1. Then ratio of the amplitudes of the two waves is
(a) 2 : 1
(b) 1 : 2
(c) 4 : 1
(d) 1 : 4 (1991)

86. In Young's experiment, two coherent sources are placed 0.90 mm apart and fringe are observed one metre away. If it produces second dark fringe at a distance of 1 mm from central fringe, the wavelength of monochromatic light is used would be
(a) 60×10^{-4} cm
(b) 10×10^{-4} cm
(c) 10×10^{-5} cm
(d) 6×10^{-5} cm (1991)

87. In Young's double slit experiment, the fringe width is found to be 0.4 mm. If the whole apparatus is immersed in water of refractive index $\frac{4}{3}$, without disturbing the geometrical arrangement, the new fringe width will be
(a) 0.30 mm
(b) 0.40 mm
(c) 0.53 mm
(d) 450 microns (1990)

88. The Young's double slit experiment is performed with blue and with green light of wavelengths 4360 Å and 5460 Å respectively. If x is the distance of 4^{th} maxima from the central one, then
(a) x(blue) = x(green)
(b) x(blue) > x(green)
(c) x(blue) < x(green)
(d) $\frac{x(\text{blue})}{x(\text{green})} = \frac{5460}{4360}$ *(1990)*

89. Interference is possible in
(a) light waves only
(b) sound waves only
(c) both light and sound waves
(d) neither light nor sound waves *(1989)*

90. A ray is incident at an angle of incidence i on one surface of a prism of small angle A and emerge normally from opposite surface. If the refractive index of the material of prism is μ, the angle of incidence i is nearely equal to
(a) $\frac{A}{\mu}$ (b) $\frac{A}{2\mu}$
(c) μA (d) $\frac{\mu A}{2}$ *(1989)*

91. Which of the phenomenon is not common to sound and light waves ?
(a) Interference (b) Diffraction
(c) Coherence (d) Polarisation *(1988)*

92. Which one of the following phenomena is not explained by Huygen's construction of wavefront ?
(a) Refraction (b) Reflection
(c) Diffraction (d) Origin of spectra *(1988)*

93. Focal length of a convex lens of refractive index 1.5 is 2 cm. Focal length of lens when immersed in a liquid of refractive index of 1.25 will be
(a) 10 cm (b) 2.5 cm
(c) 5 cm (d) 7.5 cm *(1988)*

EXPLANATIONS

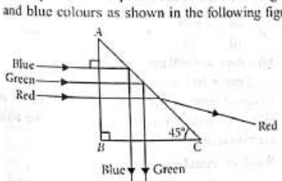
1. **(b) :** As beam of light is incident normally on the face AB of the right angled prism ABC, so no refraction occurs at face AB and it passes straight and strikes the face AC at an angle of incidence $i = 45°$.
For total reflection to take place at face AC,
$i > i_c$ or $\sin i > \sin i_c$
where i_c is the critical angle.

But as here $i = 45°$ and $\sin i_c = \frac{1}{\mu}$

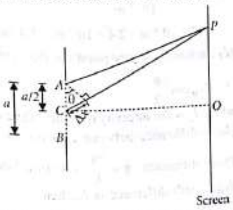
$\therefore \quad \sin 45° > \frac{1}{\mu}$ or $\frac{1}{\sqrt{2}} > \frac{1}{\mu}$

or $\mu > \sqrt{2} = 1.414$

As $\mu_{red}(= 1.39) < \mu(= 1.414)$ while $\mu_{green}(= 1.44)$ and $\mu_{blue}(= 1.47) > \mu\,(= 1.414)$, so only red colour will be transmitted through face AC while green and blue colours will suffer total internal reflection.
So the prism will separate red colour from the green and blue colours as shown in the following figure.



2. **(a) :** The situation is shown in the figure.



In figure A and B represent the edges of the slit AB of width a and C represents the midpoint of the slit.

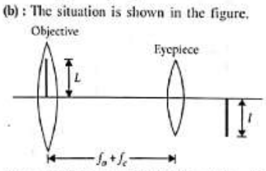
For the first minimum at P,
$a\sin\theta = \lambda$ ...(i)
where λ is the wavelength of light.
The path difference between the wavelets from A to C is

$$\Delta x = \frac{a}{2}\sin\theta = \frac{1}{2}(a\sin\theta)$$
$$= \frac{\lambda}{2} \qquad \text{(using (i))}$$

The corresponding phase difference $\Delta\phi$ is

$$\Delta\phi = \frac{2\pi}{\lambda}\Delta x = \frac{2\pi}{\lambda} \times \frac{\lambda}{2} = \pi$$

3. **(b) :** The situation is shown in the figure.



Let f_o and f_e be the focal lengths of the objective and eyepiece respectively.
For normal adjustment distance of the objective from the eyepiece (tube length) = $f_o + f_e$.
Treating the line on the objective as the object and eyepiece as the lens.
$\therefore\ u = -(f_o + f_e)$ and $f = f_e$

As $\frac{1}{v} - \frac{1}{u} = \frac{1}{f}$

$\therefore \quad \frac{1}{v} - \frac{1}{-(f_o + f_e)} = \frac{1}{f_e}$

$$\frac{1}{v} = \frac{1}{f_e} - \frac{1}{f_o + f_e} = \frac{f_o + f_e - f_e}{f_e(f_o + f_e)} = \frac{f_o}{f_e(f_o + f_e)}$$

$$\frac{1}{v} = \frac{1}{f_e} - \frac{1}{f_o + f_e} = \frac{f_o + f_e - f_e}{f_e(f_o + f_e)} = \frac{f_o}{f_e(f_o + f_e)}$$

or $v = \frac{f_e(f_o + f_e)}{f_o}$

Thus, $\frac{I}{L} = \frac{v}{u} = \frac{\frac{f_e(f_o + f_e)}{f_o}}{(f_o + f_e)} = \frac{f_e}{f_o}$

or $\dfrac{f_o}{f_e}=\dfrac{L}{I}$ ...(i)

$\therefore$ The magnification of the telescope in normal adjustment is

$m=\dfrac{f_o}{f_e}=\dfrac{L}{I}$ (using (i))

4. **(c)** : As, intensity $I \propto$ width of slit W
Also, intensity $I \propto$ square of amplitude A

$\therefore \quad \dfrac{I_1}{I_2}=\dfrac{W_1}{W_2}=\dfrac{A_1^2}{A_2^2}$

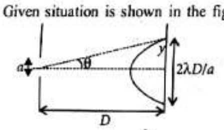
But $\dfrac{W_1}{W_2}=\dfrac{1}{25}$ (given)

$\therefore \quad \dfrac{A_1^2}{A_2^2}=\dfrac{1}{25}$ or $\dfrac{A_1}{A_2}=\sqrt{\dfrac{1}{25}}=\dfrac{1}{5}$

$$\therefore \quad \frac{I_{max}}{I_{min}}=\frac{(A_1+A_2)^2}{(A_1-A_2)^2}=\frac{\left(\frac{A_1}{A_2}+1\right)^2}{\left(\frac{A_1}{A_2}-1\right)^2}$$

$$=\frac{\left(\frac{1}{5}+1\right)^2}{\left(\frac{1}{5}-1\right)^2}=\frac{\left(\frac{6}{5}\right)^2}{\left(-\frac{4}{5}\right)^2}=\frac{36}{16}=\frac{9}{4}$$

5. **(c)** : Given situation is shown in the figure.



For central maxima, $\sin\theta=\dfrac{\lambda}{a}$

Also, θ is very-very small so

$\sin\theta \approx \tan\theta=\dfrac{y}{D}$

$\therefore \quad \dfrac{y}{D}=\dfrac{\lambda}{a},\ y=\dfrac{\lambda D}{a}$

Width of central maxima $=2y=\dfrac{2\lambda D}{a}$.

6. **(a)**

7. **(d)** : As $\mu=\dfrac{\sin\left(\dfrac{A+\delta}{2}\right)}{\sin\left(\dfrac{A}{2}\right)}$

$\cot\dfrac{A}{2}=\dfrac{\sin\left(\dfrac{A+\delta}{2}\right)}{\sin\left(\dfrac{A}{2}\right)}$ $\left[\because \mu=\cot\dfrac{A}{2}\right]$

$\dfrac{\cos\left(\dfrac{A}{2}\right)}{\sin\left(\dfrac{A}{2}\right)}=\dfrac{\sin\left(\dfrac{A+\delta}{2}\right)}{\sin\left(\dfrac{A}{2}\right)}$

$\sin\left(\dfrac{\pi}{2}-\dfrac{A}{2}\right)=\sin\left(\dfrac{A}{2}+\dfrac{\delta}{2}\right);\ \dfrac{\pi}{2}-\dfrac{A}{2}=\dfrac{A}{2}+\dfrac{\delta}{2}$

$\therefore\ \delta=\pi-2A=180^\circ-2A$

8. **(c)** : For double slit experiment,
$d=1\text{ mm}=1\times10^{-3}\text{ m}, D=1\text{ m}, \lambda=500\times10^{-9}\text{ m}$

Fringe width $\beta=\dfrac{D\lambda}{d}$

Width of central maxima in a single slit

As per question, width of central maxima of single slit pattern = width of 10 maxima of double slit pattern

$\dfrac{2\lambda D}{a}=10\left(\dfrac{\lambda D}{d}\right)$

$a=\dfrac{2d}{10}=\dfrac{2\times10^{-3}}{10}=0.2\times10^{-3}\text{ m}=0.2\text{ mm}$

9. **(d)** : Here, $\lambda=600\text{ nm}=600\times10^{-9}\text{ m}$
$a=1\text{ mm}=10^{-3}\text{ m}, D=2\text{ m}$

Distance between the first dark fringes on either side of the central bright fringe is also the width of central maximum.

Width of central maximum $=\dfrac{2\lambda D}{a}$

$=\dfrac{2\times600\times10^{-9}\text{ m}\times2\text{ m}}{10^{-3}\text{ m}}$

$=24\times10^{-4}\text{ m}=2.4\times10^{-3}\text{ m}=2.4\text{ mm}$

10. **(c)** : Intensity at any point on the screen is

$I=4I_0\cos^2\dfrac{\phi}{2}$

where I_0 is the intensity of either wave and ϕ is the phase difference between two waves.

Phase difference, $\phi=\dfrac{2\pi}{\lambda}\times$ Path difference

When path difference is λ, then

$\phi=\dfrac{2\pi}{\lambda}\times\lambda=2\pi$

$\therefore \quad I=4I_0\cos^2\left(\dfrac{2\pi}{2}\right)=4I_0\cos^2(\pi)=4I_0=K$ ...(i)

When path difference is $\dfrac{\lambda}{4}$, then

$\phi=\dfrac{2\pi}{\lambda}\times\dfrac{\lambda}{4}=\dfrac{\pi}{2}$

$\therefore \quad I=4I_0\cos^2\left(\dfrac{\pi}{4}\right)=2I_0=\dfrac{K}{2}$ [Using (i)]

11. **(d)** : Magnifying power of a microscope,

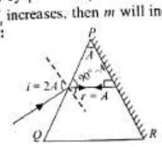
$m=\left(\dfrac{L}{f_o}\right)\left(\dfrac{D}{f_e}\right)$

where f_o and f_e are the focal lengths of the objective and eyepiece respectively and L is the distance between their focal points and D is the least distance of distinct vision.
If f_o increases, then m will decrease.

Magnifying power of a telescope, $m=\dfrac{f_o}{f_e}$

where f_o and f_e are the focal lengths of the objective and eyepiece respectively.
If f_o increases, then m will increase.

12. **(b)** :



On reflection from the silvered surface, the incident ray will retrace its path, if it falls normally on the surface.
By geometry, $r=A$
Applying Snell's law at surface PQ,
$1\sin i=\mu\sin r$

$\mu=\dfrac{\sin i}{\sin r}=\dfrac{\sin 2A}{\sin A}=2\cos A$

13. **(a)** : The combination of two lenses 1 and 2 is as shown in figure.

$\therefore \quad \dfrac{1}{f}=\dfrac{1}{f_1}+\dfrac{1}{f_2}$

According to lens maker's formula

$\dfrac{1}{f_1}=(\mu_1-1)\left(\dfrac{1}{\infty}-\dfrac{1}{-R}\right)=\dfrac{(\mu_1-1)}{R}$

$\dfrac{1}{f_2}=(\mu_2-1)\left(\dfrac{1}{-R}-\dfrac{1}{\infty}\right)$

$=(\mu_2-1)\left(-\dfrac{1}{R}\right)=-\dfrac{(\mu_2-1)}{R}$

$\therefore \quad \dfrac{1}{f}=\dfrac{(\mu_1-1)}{R}-\dfrac{(\mu_2-1)}{R}$

$\dfrac{1}{f}=\dfrac{(\mu_1-\mu_2)}{R}$

$f=\dfrac{R}{(\mu_1-\mu_2)}$

14. **(d)** : Let n_1 bright fringe of λ_1 coincides with n_2 bright fringe of λ_2. Then

$\dfrac{n_1\lambda_1 D}{d}=\dfrac{n_2\lambda_2 D}{d}$ or $n_1\lambda_1=n_2\lambda_2$

$\dfrac{n_1}{n_2}=\dfrac{\lambda_2}{\lambda_1}=\dfrac{10000}{12000}=\dfrac{5}{6}$

Let x be given distance.

$\therefore \quad x=\dfrac{n_1\lambda_1 D}{d}$

Here, $n_1=5, D=2\text{ m}, d=2\text{ mm}=2\times10^{-3}\text{ m}$
$\lambda_1=12000\text{ Å}=12000\times10^{-10}\text{ m}=12\times10^{-7}\text{ m}$

$x=\dfrac{5\times12\times10^{-7}\text{ m}\times2\text{ m}}{2\times10^{-3}\text{ m}}=6\times10^{-3}\text{ m}=6\text{ mm}$

15. **(a)** : Converging power of cornea, $P_c=+40$ D
Least converging power of eye lens, $P_e=+20$ D
Power of the eye-lens, $P=P_c+P_e$
$=40\text{ D}+20\text{ D}=60\text{ D}$

Power of the eye lens

$P=\dfrac{1}{\text{Focal length of the eye lens }(f)}$

$f=\dfrac{1}{P}=\dfrac{1}{60\text{ D}}=\dfrac{1}{60}\text{ m}=\dfrac{100}{60}\text{ cm}=\dfrac{5}{3}\text{ cm}$

Distance between the retina and cornea-eye lens
= Focal length of the eye lens

$=\dfrac{5}{3}\text{ cm}=1.67\text{ cm}$

16. **(a)** : de Broglie wavelength of an electron

$\lambda=\dfrac{h}{p}=\dfrac{h}{mv}$

where m is the mass and v is the speed of the electron respectively.
If speed v of electron is increased, momentum $p(=mv)$ will increase. Hence, wavelength λ will decrease.
Angular width of the central maximum is

$\theta_0=\dfrac{2\lambda}{a}$

where a is the width of slit.
If λ decreases, θ_0 will decrease.
Therefore, the correct statement is (a).

17. (b) : Fringe width, $\beta = \frac{\lambda D}{d}$
where D is the distance between slits and screen and d is the distance between the slits.
When D is doubled and d is reduced to half, then fringe width becomes

$$\beta' = \frac{\lambda(2D)}{(d/2)} = \frac{4\lambda D}{d} = 4\beta$$

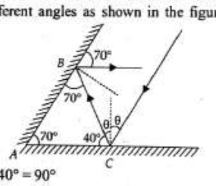
18. (c) : For the second minimum,
Path difference $= 2\lambda$
Therefore, corresponding value of phase difference is

$$\Delta\phi = \frac{2\pi}{\lambda} \times \text{Path difference}$$

$$\therefore \Delta\phi = \frac{2\pi}{\lambda} \times 2\lambda = 4\pi$$

19. (a) : The reddish appearance of the sun at sunrise and sunset is due to the scattering of light.

20. (d) : Different angles as shown in the figure.



$$\theta + 40° = 90°$$
$$\therefore \theta = 90° - 40° = 50°$$

21. (a) : According to lens maker's formula

$$\frac{1}{f} = \left(\frac{\mu_g}{\mu_L} - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

where μ_g is the refractive index of the material of the lens and μ_L is the refractive index of the liquid in which lens is dipped.
As the biconvex lens dipped in a liquid acts as a plane sheet of glass, therefore

$$f = \infty \Rightarrow \frac{1}{f} = 0$$

$$\therefore \frac{\mu_g}{\mu_L} - 1 = 0 \text{ or } \mu_g = \mu_L$$

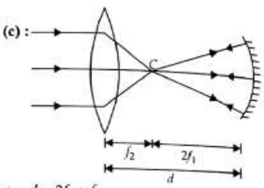
22. (a) : As the emergent ray emerges normally from the opposite face,
$\therefore e = 0, r_2 = 0$ As $r_1 + r_2 = A$
$\therefore r_1 = A$
Applying Snell's law for incident ray
$1\sin i = \mu \sin r_1 = \mu \sin A$

or $\mu = \frac{\sin i}{\sin A}$

For small angle, $\sin i \approx i$, $\sin A \approx A$

$\therefore \mu = \frac{i}{A}$ or $i = \mu A$

23. (c) :



$\therefore d = 2f_1 + f_2$

24. (c) : Magnifying power, $m = \frac{f_o}{f_e} = 9$ ...(i)
where f_o and f_e are the focal lengths of the objective and eyepiece respectively
Also, $f_o + f_e = 20$ cm ...(ii)
On solving (i) and (ii), we get
$f_o = 18$ cm, $f_e = 2$ cm

25. (b) : As $\mu = \frac{\sin\left(\frac{A+\delta_m}{2}\right)}{\sin\left(\frac{A}{2}\right)}$

$$\mu = \frac{\sin\left(\frac{A+A}{2}\right)}{\sin\left(\frac{A}{2}\right)} = \frac{\sin A}{\sin\left(\frac{A}{2}\right)} \quad (\because \delta_m = A\text{(Given)})$$

$$= \frac{2\sin\left(\frac{A}{2}\right)\cos\left(\frac{A}{2}\right)}{\sin\left(\frac{A}{2}\right)} = 2\cos\left(\frac{A}{2}\right)$$

As $\delta = i + e - A$
At minimum deviation, $\delta = \delta_m$, $i = e$
$\therefore \delta_m = 2i - A$
$2i = \delta_m + A$

$$i = \frac{\delta_m + A}{2} = \frac{A+A}{2} = A \quad (\because \delta_m = A\text{(given)})$$

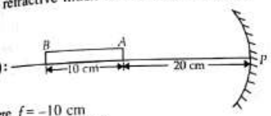
Then,
$\mu_{max} = 2\cos 0° = 2$

$\because i_{max} = \frac{\pi}{2} \Rightarrow A_{max} = \frac{\pi}{2}$

Then,
$\mu_{min} = 2\cos 45° = 2 \times \frac{1}{\sqrt{2}} = \sqrt{2}$

So refractive index lies between 2 and $\sqrt{2}$.

26. (d) :



Here, $f = -10$ cm
For end A, $u_A = -20$ cm
Image position of end A,

$$\frac{1}{v_A} + \frac{1}{u_A} = \frac{1}{f}$$

$$\frac{1}{v_A} + \frac{1}{(-20)} = \frac{1}{(-10)} \text{ or } \frac{1}{v_A} = \frac{1}{-10} + \frac{1}{20} = -\frac{1}{20}$$

$v_A = -20$ cm
For end B, $u_B = -30$ cm
Image position of end B,

$$\frac{1}{v_B} + \frac{1}{u_B} = \frac{1}{f}$$

$$\frac{1}{v_B} + \frac{1}{(-30)} = \frac{1}{(-10)} \text{ or } \frac{1}{v_B} = \frac{1}{-10} + \frac{1}{30} = -\frac{2}{30}$$

$v_B = -15$ cm
Length of the image

$$= |v_A| - |v_B| = 20\text{ cm} - 15\text{ cm} = 5\text{ cm}$$

27. (b) : Difference between apparent and real depth of a pond is due to refraction. Other three are due to total internal reflection.

28. (c) : Let $\mu = \frac{3}{2}$
According to lens maker's formula

$$\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

For biconvex lens, $R_1 = +20$ cm, $R_2 = -20$ cm

$$\therefore \frac{1}{f} = \left(\frac{3}{2} - 1\right)\left(\frac{1}{20} + \frac{1}{20}\right) = \frac{1}{20} \text{ or } f = 20\text{ cm}$$

According to thin lens formula

$$\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$$

Here, $u = -30$ cm

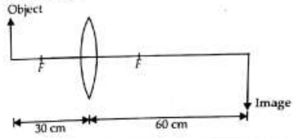
$$\therefore \frac{1}{20} = \frac{1}{v} - \frac{1}{-30} \Rightarrow \frac{1}{v} = \frac{1}{20} - \frac{1}{30}$$

$v = 60$ cm
The image is formed at a distance of 60 cm on the right hand side of the lens. It is a real image.

Magnification, $m = \frac{v}{u} = \frac{h_I}{h_0}$

$$\frac{60\text{ cm}}{-30\text{ cm}} = \frac{h_I}{2\text{ cm}} \Rightarrow h_I = -4\text{ cm}$$

–ve sign shows that image is inverted.
The image is real, inverted and height of 4 cm as shown in figure.



Note : In this question the value of refractive index is not given.

29. (c) : For dispersion without deviation

$$\delta_1 + \delta_2 = 0$$
$$(\mu_1 - 1)A_1 + (\mu_2 - 1)A_2 = 0$$
$$A_2 = -\frac{(\mu_1 - 1)A_1}{(\mu_2 - 1)}$$

Substituting the given values, we get

$$A_2 = -\frac{(1.5 - 1)15°}{(1.75 - 1)} = -10°$$

–ve sign shows that two prisms must be joined in opposition.

30. (d) : Here, $v = +15$ cm, $u = +(15 - 5) = +10$ cm
According to lens formula

$$\frac{1}{v} - \frac{1}{u} = \frac{1}{f} \Rightarrow \frac{1}{15} - \frac{1}{10} = \frac{1}{f}$$

$\Rightarrow f = -30$ cm

31. (c) : For total internal reflection,
$\sin i > \sin C$

where,
i = angle of incidence
C = critical angle

But, $\sin C = \frac{1}{\mu}$

$\therefore \quad \sin i > \frac{1}{\mu}$ or $\mu > \frac{1}{\sin i}$

$\mu > \frac{1}{\sin 45°}$ $\qquad (i = 45° \text{ (Given)})$

$\mu > \sqrt{2}$

Hence, option (c) is correct.

32. **(c) :** Focal length of the lens remains same. Intensity of image formed by lens is proportional to area exposed to incident light from object.
i.e. Intensity $\propto$ area

or $\frac{I_2}{I_1} = \frac{A_2}{A_1}$

Initial area, $A_1 = \pi\left(\frac{d}{2}\right)^2 = \frac{\pi d^2}{4}$

After blocking, exposed area,

$$A_2 = \frac{\pi d^2}{4} - \frac{\pi(d/2)^2}{4} = \frac{\pi d^2}{4} - \frac{\pi d^2}{16} = \frac{3\pi d^2}{16}$$

$$\therefore \quad \frac{I_2}{I_1} = \frac{A_2}{A_1} = \frac{\frac{3\pi d^2}{16}}{\frac{\pi d^2}{4}} = \frac{3}{4}$$

or $I_2 = \frac{3}{4} I_1 = \frac{3}{4} I \qquad (\because I_1 = I)$

Hence, focal length of a lens = f, intensity of the image $= \frac{3I}{4}$

33. **(c) :** Refractive index for medium M_1 is

$$\mu_1 = \frac{c}{v_1} = \frac{3\times10^8}{1.5\times10^8} = 2$$

Refractive index for medium M_2 is

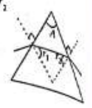
$$\mu_2 = \frac{c}{v_2} = \frac{3\times10^8}{2.0\times10^8} = \frac{3}{2}$$

For total internal reflection
$\sin i \geq \sin C$
where i = angle of incidence
C = critical angle

But $\sin C = \frac{\mu_2}{\mu_1}$

$\sin i \geq \frac{\mu_2}{\mu_1} \geq \frac{3/2}{2} \Rightarrow i \geq \sin^{-1}\left(\frac{3}{4}\right)$

34. **(b) :** Angle of prism, $A = r_1 + r_2$
For minimum deviation
$r_1 = r_2 = r \quad \therefore A = 2r$



Given, $A = 60°$

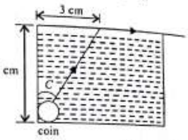
Hence, $r = \frac{A}{2} = \frac{60°}{2} = 30°$

35. **(b) :** $\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2}$; $\quad \therefore$ Power $P = \frac{f_1 + f_2}{f_1 f_2}$

36. **(c) :** $\frac{\text{size of image}}{\text{size of object}} = \left|\frac{v}{u}\right|$

$\Rightarrow$ size of the image $= \frac{1.39\times10^9\times10^{-1}}{1.5\times10^{11}} = 0.92\times10^{-3}$ m
$= 0.92 \times 10^{-3}$ m.
size of the image $= 9.2 \times 10^{-4}$ m

37. **(d) :**



From figure, $\sin C = \frac{3}{\sqrt{(4)^2 + (3)^2}} = \frac{3}{5}$

where C is the critical angle.
Also, $\sin C = {}^l\mu_a$

$\sin C = \frac{1}{{}^a\mu_l} \quad \left[\text{since } {}^l\mu_a = \frac{1}{{}^a\mu_l}\right]$

Also ${}^a\mu_l = \frac{\text{velocity of light in air } (c)}{\text{velocity of light in liquid } (v)}$

$\therefore \quad \sin C = \frac{v}{c} = \frac{v}{3\times10^8}$

or, $\quad v = 3\times10^8 \times \frac{3}{5} = 1.8\times10^8 \text{ ms}^{-1}$.

38. **(b) :** $\mu = \frac{\text{velocity of light in vacuum } (c)}{\text{velocity of light in medium } (v)}$

$\therefore \quad v = \upsilon\lambda = 2 \times 10^{14} \times 5000 \times 10^{-10}$
In the medium, $v = 10^8$ m/s

$\therefore \quad \mu = \frac{v_{vac}}{v_{med}} = \frac{3\times10^8}{10^8} = 3.$

39. **(b) :** Apparent depth $= \frac{\text{real depth}}{\mu} = \frac{3}{1.5} = 2$ cm
As image appears to be raised by 1 cm, therefore, microscope must be moved upwards by 1 cm.

40. **(a) :** Focal length of convex lens $f_1 = 25$ cm
Focal length of concave lens $f_2 = -25$ cm
Power of combination in dioptres,

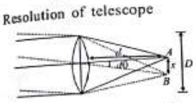
$$P = P_1 + P_2 = \frac{100}{f_1} + \frac{100}{f_2} = \frac{100}{25} - \frac{100}{25} = 0.$$

41. **(c) :** R.P. $= 1/\Delta\theta$

The angular resolution, $\Delta\theta = \frac{1.22\lambda}{D}$

$$= \frac{1.22\times5000\times10^{-8}}{0.1} = 6.1\times10^{-4} = 10^{-4}.$$

42. **(c) :** Resolution of telescope



$d\theta = 1.22\frac{\lambda}{D} = 1.22 \times \frac{5000\times10^{-8}}{10} \quad \tan\theta \simeq d\theta$

$x = d\theta \times d = \frac{1.22\times5000\times10^{-8}\times10^5}{10} \quad [d = 10^5 \text{ cm}]$

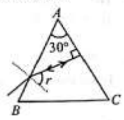
$\simeq 5$ mm

43. **(a) :** $\angle r = 30°$ (using law of triangle)

$\Rightarrow \mu = \frac{\sin i}{\sin r}$

$\Rightarrow \sqrt{2} \times \sin 30 = \sin i$

$\Rightarrow \sin i = \frac{1}{\sqrt{2}} \Rightarrow i = 45°$

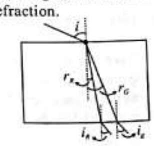


44. **(b) :** The velocities of different colours is different in a given medium. Red and green are refracted at different angle of refraction.

$\frac{\sin i}{\sin r_R} = \mu \quad$ ...(i)

$\frac{\sin i}{\sin r_G} = \mu \quad$ ...(ii)

$\frac{\sin r_p}{\sin i_p} = \mu \quad$ ...(iii)

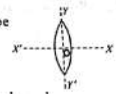


From equation (i), (ii) and (iii)
$\Rightarrow i = i_R = i_G$
Thus two point propagation in two different parallel direction.

45. **(a) :** Since the lens is equiconvex, the radius of curvature of each half is same, say R. We know from Lens maker's formula

$\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

(considering the lens to be placed in air)



Here $R_1 = R$
$R_2 = -R$ by convection

$\therefore \quad \frac{1}{f} = (\mu-1)\frac{2}{R} \Rightarrow (\mu-1)\frac{1}{R} = \frac{1}{2f} \quad$ ...(i)

If we cut the lens along XOX' then the two halves of the lens will be having the same radii of curvature and so, focal length $f' = f$

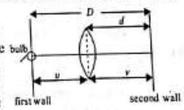
But when we cut it along YOY' then, we will have $R_1 = R$ but $R_2 = \infty$

$\therefore \quad \frac{1}{f''} = (\mu-1)\left(\frac{1}{R} - \frac{1}{\infty}\right) = (\mu-1)\frac{1}{R} = \frac{1}{2f}$

$\Rightarrow f'' = 2f.$

46. **(b) :** When refractive index of lens is equal to the refractive index of liquid, the lens behave like a plane surface with focal length infinity.

47. **(b) :** A real image is to be formed on the 2nd wall of the bulb placed on the first wall by the convex lens. The lens is placed at a distance of d from the 2nd wall.



Now, we know that to form a real image of an object on a screen by a convex lens, the distance between the source and the screen (D) should be equal to $4f$, where f is the focal length of the lens.
In that case, $u = v = D/2 = d$.
$\therefore \quad f = D/4 = d/2.$

48. **(c) :** Resolving power of eyelens

$= \frac{d}{\lambda} = \frac{2\times10^{-1}}{5000\times10^{-8}} = \frac{1}{d\theta}$

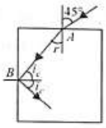
[Given d = diameter of lens = 2 mm = 2×10^{-1} cm, $\lambda = 5000$ Å $= 5000 \times 10^{-8}$ cm].

Let S be the minimum distance between two points so that it may be resolved.

$\therefore$ $S = rd\theta$. Here $r = 50$ m $= 5000$ cm.

$\therefore$ $S = 5000 \times \dfrac{5000 \times 10^{-8}}{2 \times 10^{-1}} = 1.25$ cm .

49. (c) : Applying Snell's law of refraction at A, we get



$\mu = \dfrac{\sin i}{\sin r} = \dfrac{\sin 45°}{\sin r}$

$\therefore$ $\sin r = 1/\sqrt{2}\mu$

$\therefore$ $r = \sin^{-1}\left(\dfrac{1}{\sqrt{2}\mu}\right)$ ... (i)

Applying the condition of total internal reflection at B, we get

$i_c = \sin^{-1}(1/\mu)$ ... (ii)

where i_c is the critical angle.

Now, $r + i_c = 90° = \pi/2$.

$\therefore$ $\sin^{-1}\dfrac{1}{\sqrt{2}\mu} = \dfrac{\pi}{2} - \sin^{-1}\dfrac{1}{\mu}$

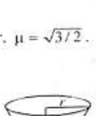
or, $\sin^{-1}\dfrac{1}{\sqrt{2}\mu} = \cos^{-1}\dfrac{1}{\mu}$

$\therefore$ $\dfrac{1}{\sqrt{2}\mu} = \dfrac{\sqrt{\mu^2 - 1}}{\mu}$ or $\dfrac{1}{2} = \mu^2 - 1$. $\therefore$ $\mu = \sqrt{3/2}$.

50. (a)

51. (b) : Frequency remains same.

52. (b) : θ is the critical angle.



$\therefore$ $\theta = \sin^{-1}(1/\mu) = \sin^{-1}(3/5)$

or, $\sin\theta = 3/5$.

$\therefore$ $\tan\theta = 3/4 = r/4$ or, $r = 3$ m.

53. (c) : Total apparent depth,

$y = y_1 + y_2 = 5 + 2 = 7$ cm.

If x is real depth = thickness of slab, then as

$\mu = \dfrac{\text{real depth}}{\text{apparent depth}} = \dfrac{x}{y}$

or, $x = \mu y = 1.5 \times 7 = 10.5$ cm.

54. (b) : The minimum mirror length should be half of the height of man.

55. (a) : $\dfrac{1}{f} = (\mu - 1)\left[\dfrac{1}{R_1} - \dfrac{1}{R_2}\right] = (1.5 - 1)\left[\dfrac{1}{\infty} - \dfrac{1}{(-10)}\right]$

$= 0.5\left[\dfrac{1}{10}\right] \Rightarrow f = 20$ cm

When plane surface is silvered,

$F = \dfrac{f}{2} = \dfrac{20}{2} = 10$ cm.

56. (b) : The rainbow is an example of the dispersion of sunlight by the water drops in the atmosphere. This is a phenomenon due to a combination of the refraction of sunlight by spherical water droplets and of internal (not total) reflection.

57. (b) : $R_1 = +\infty$

$R_2 = -60$ cm

$\dfrac{1}{f} = (\mu - 1)\left(\dfrac{1}{R_1} - \dfrac{1}{R_2}\right)$

$\dfrac{1}{f} = (1.6 - 1)\left(\dfrac{1}{\infty} - \dfrac{1}{-60}\right)$ or $f = 100$ cm

58. (a)

59. (a) : $A = 60°$, $\mu = \sqrt{3}$, $\delta_m = ?$

$\mu = \dfrac{\sin\left(\dfrac{A + \delta_m}{2}\right)}{\sin\dfrac{A}{2}}$ $\therefore$ $\delta_m = 60°$

60. (a) : For lens, $\dfrac{1}{v} - \dfrac{1}{u} = \dfrac{1}{f}$

$u = -30$, $f = 20$, $v = 60$ cm

To have an upright image of the object, coincide with it, image should tend to form at centre of curvature of convex mirror. Therefore, the distance of convex mirror from the lens $= 60 - 10 = 50$ cm

61. (c) : $n > \dfrac{\sin r}{\sin i}$

i.e., $n > \dfrac{\sin 90°}{\sin 45°} \Rightarrow n > \sqrt{2}$

62. (d) : Length of astronomical telescope $(f_o + f_e) = 44$ cm and ratio of focal length of the objective lens to that of the eye piece $\dfrac{f_o}{f_e} = 10$.

From the given ratio, we find that $f_o = 10f_e$.

Therefore $10f_e + f_e = 44$ or $f_e = 4$ cm

and focal length of the objective (f_o)

$= 44 - f_e = 44 - 4 = 40$ cm.

63. (a) : $\dfrac{1}{f} = (\mu - 1)\left(\dfrac{1}{R_1} - \dfrac{1}{R_2}\right)$

Since the refractive index of violet colour (μ_v) is greater than the refractive index of red colour (μ_r), therefore focal length of violet colour is less than the focal length of red colour or in other words $f_v < f_r$.

64. (d) : Frequency $= n$; Wavelength $= \lambda$; Velocity of air $= v$ and refractive index of glass slab $= \mu$. Frequency of light remains the same, when it changes the medium. Refractive index is the ratio of wavelengths in vacuum and in the given medium. Similarly refractive index is also the ratio of velocities in vacuum and in the given medium.

65. (b) : Focal length $(f_1) = 80$ cm and $(f_2) = -50$ cm (Minus sign due to concave lens)

Power of the combination (P)

$= P_1 + P_2 = \dfrac{100}{f_1} + \dfrac{100}{f_2} = \dfrac{100}{80} - \dfrac{100}{50} = -0.75$ D.

66. (d) : Refractive index of water $(\mu_2) = 1.33$.

$\dfrac{v_2}{v_1} = \dfrac{\mu_1}{\mu_2} = \dfrac{1}{1.33}$

Therefore $v_2 = \dfrac{v_1}{1.33} = \dfrac{3 \times 10^8}{1.33} = 2.25 \times 10^8$ m/s.

67. (a) : According to Snell's law,

$\mu = \dfrac{\sin i}{\sin r'} = \dfrac{\sin i}{\sin(90° - r)} = \dfrac{\sin i}{\cos r}$

From law of reflection, $i = r$.

$\therefore$ $\mu = \dfrac{\sin r}{\cos r} = \tan r$

Critical angle $= \sin^{-1}(\mu) = \sin^{-1}(\tan r)$.

68. (b) : For a convex lens, $f_R > f_V$ or $f_V < f_R$. For a concave lens, focal length is negative.

$\therefore$ $|F_V| < |F_R|$ or $F_V > F_R$ as the smaller negative value is bigger.

69. (b) : Time $= \dfrac{\text{distance}}{\text{velocity}} = \dfrac{t}{v} = \dfrac{t}{c/\mu} = \dfrac{\mu t}{c}$

70. (c) : By displacement method, size of object $(O) = \sqrt{I_1 \times I_2}$.

Therefore area of source of light $(A) = \sqrt{A_1 A_2}$.

71. (c) : Time of exposure $t \propto (f\text{ - number})^2$

$\therefore$ $\dfrac{t}{\left(\dfrac{1}{200}\right)} = \left(\dfrac{5.6}{2.8}\right)^2 = 4$ or $t = 0.02$ s

72. (d) : Separations between the slits $(d_1) = 16$ cm and $(d_2) = 9$ cm.

Actual distance of separation

$(d) = \sqrt{d_1 d_2} = \sqrt{16 \times 9} = 12$ cm .

73. (a) : Magnifying power of telescope, $M = f_o/f_e$

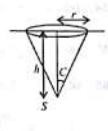
To produce largest magnifications $f_o > f_e$ and f_o and f_e both should be positive (convex lens).

Therefore $f_e = +15$ cm.

74. (a) : According to Rayleigh, the amount of scattering is inversely proportional to the fourth power of the wavelength.

75. (d)

76. (a) : In order to cut off all the light coming out of water surface, angle C should be equal to critical angle.



i.e. $\sin C = \dfrac{1}{\mu} = \dfrac{1}{5/3} = \dfrac{3}{5}$.

$\therefore$ $\tan C = 3/4$.

Now, $\tan C = \dfrac{r}{h}$;

$r = h\tan C = 4 \times \dfrac{3}{4} = 3$ m

Diameter of disc $= 2r = 6$ m.

77. (c) : For first minimum, $a\sin\theta = n\lambda = 1\lambda$

$\sin\theta = \dfrac{\lambda}{a} = \dfrac{5000 \times 10^{-10}}{0.001 \times 10^{-3}} = 0.5$

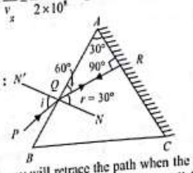
$\theta = 30°$.

78. (d) : In vacuum, λ increases very slightly compared to that in air. As $\beta \propto \lambda$, therefore, width of interference fringe increases slightly.

79. (c) : $v_g = \dfrac{c}{\mu} = \dfrac{3 \times 10^8}{\dfrac{3}{2}} = 2 \times 10^8$ m/s

$t = \dfrac{x}{v_g} = \dfrac{4 \times 10^{-3}}{2 \times 10^8} = 2 \times 10^{-11}$ s

80. (c) :



The ray will retrace the path when the refrated ray QR is incident normally on the polished surface AC. Thus angle of refraction $r = 30°$

$\mu = \dfrac{\sin i}{\sin r}$

$\therefore$ $\sin i = \mu \times \sin r = \sqrt{2} \times \sin 30°$

$$\sin i = \sqrt{2} \times \frac{1}{2} = \frac{1}{\sqrt{2}} \text{ or } i = \sin^{-1}\frac{1}{\sqrt{2}} = 45°$$

81. **(a) :** As $\beta = \frac{\lambda D}{d}$ and $\lambda_b < \lambda_y$,

$\therefore$ Fringe width β will decrease

82. **(b) :** $x = (n)\lambda\frac{D}{d} = 3 \times 5000 \times 10^{-10} \times \frac{2}{0.2 \times 10^{-3}}$

$= 1.5 \times 10^{-2}\text{ m} = 1.5\text{ cm}$

83. **(c) :** λ' of refracted light is smaller, because $\lambda' = \frac{\lambda}{\mu}$

84. **(a) :** $\lambda_g = \frac{\lambda_a}{\mu} = \frac{5460}{1.5} = 3640\text{ Å}$

85. **(a) :** $\frac{I_1}{I_2} = \frac{a^2}{b^2} = \frac{4}{1}$ $\therefore \frac{a}{b} = \frac{2}{1}$

86. **(d) :** For dark fringe $x = (2n-1)\frac{\lambda D}{2d}$

$\therefore \quad \lambda = \frac{2xd}{(2n-1)D} = \frac{2 \times 10^{-3} \times 0.9 \times 10^{-3}}{(2 \times 2 - 1) \times 1}$

$\lambda = 0.6 \times 10^{-6}\text{ m} = 6 \times 10^{-5}\text{ cm}$

87. **(a) :** $\beta' = \frac{\beta}{\mu} = \frac{0.4}{\frac{4}{3}} = 0.3\text{ mm}$

88. **(c) :** Distance of n^{th} maxima $x = n\lambda\frac{D}{d} \propto \lambda$

As $\lambda_b = \lambda_g$

$\therefore \quad x(\text{blue}) < x(\text{green})$.

89. **(c) :** Interference is a wave phenomenon shown by both the light waves and sound waves.

90. **(c) :** As refracted ray emerges normally from opposite surface, $r_2 = 0$

As $A = r_1 + r_2 \qquad \therefore r_1 = A$

Now, $\mu = \frac{\sin i_1}{\sin r_1} = \frac{i_1}{r_1} = \frac{i}{A}; i = \mu A$

91. **(d) :** Sound waves can not be polarised as they are longitudinal. Light waves can be polarised as they are transverse.

92. **(d) :** Huygen's construction of wavefront does not apply to origin of spectra which is explained by quantum theory.

93. **(c) :** $\frac{f_a}{f_e} = \frac{\left(\frac{\mu_g}{\mu_l} - 1\right)}{(\mu_g - 1)} = \frac{\left(\frac{1.5}{1.25} - 1\right)}{1.5 - 1} = \frac{\frac{1}{5}}{\frac{1}{2}} = \frac{2}{5}$

$f_e = \frac{5}{2}f_a = \frac{5}{2} \times 2 = 5\text{ cm}$

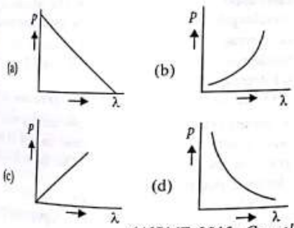
CHAPTER

19 Dual Nature of Radiation and Matter

1. A photoelectric surface is illuminated successively by monochromatic light of wavelength λ and If the maximum kinetic energy of the emitted photoelectrons in the second case is 3 times that in the first case, the work function of the surface of the material is
(h = Planck's constant, c = speed of light)
(a) $\frac{2hc}{\lambda}$ (b) $\frac{hc}{3\lambda}$
(c) $\frac{hc}{2\lambda}$ (d) $\frac{hc}{\lambda}$
(AIPMT 2015)

2. Light of wavelength 500 nm is incident on a metal with work function 2.28 eV. The de Broglie wavelength of the emitted electron is
(a) $\geq 2.8 \times 10^{-9}$ m (b) $\leq 2.8 \times 10^{-12}$ m
(c) $< 2.8 \times 10^{-10}$ m (d) $< 2.8 \times 10^{-9}$ m
(AIPMT 2015)

3. Which of the following figures represent the variation of particle momentum and the associated de-Broglie wavelength?



(AIPMT 2015, Cancelled)

4. A certain metallic surface is illuminated with monochromatic light of wavelength, λ. The stopping potential for photo-electric current for this light is $3V_0$. If the same surface is illuminated with light of wavelength 2λ, the stopping potential is V_0. The threshold wavelength for this surface for photo-electric effect is
(a) $\frac{\pi}{4}$ (b) $\frac{\lambda}{6}$
(c) 6λ (d) 4λ
(AIPMT 2015, Cancelled)

5. When the energy of the incident radiation is increased by 20%, the kinetic energy of the photoelectrons emitted from a metal surface increased from 0.5 eV to 0.8 eV. The work function of the metal is
(a) 0.65 eV (b) 1.0 eV
(c) 1.3 eV (d) 1.5 eV
(AIPMT 2014)

6. If the kinetic energy of the particle is increased to 16 times its previous value, the percentage change in the de Broglie wavelength of the particle is
(a) 25 (b) 75
(c) 60 (d) 50 *(AIPMT 2014)*

7. The wavelength λ_e of an electron and λ_p of a photon of same energy E are related by
(a) $\lambda_p \propto \sqrt{\lambda_e}$ (b) $\lambda_p \propto \frac{1}{\sqrt{\lambda_e}}$
(c) $\lambda_p \propto \lambda_e^2$ (d) $\lambda_p \propto \lambda_e$ *(NEET 2013)*

8. For photoelectric emission from certain metal the cutoff frequency is υ. If radiation of frequency 2υ impinges on the metal plate, the maximum possible velocity of the emitted electron will be (m is the electron mass)
(a) $\sqrt{\frac{2h\upsilon}{m}}$ (b) $2\sqrt{\frac{h\upsilon}{m}}$
(c) $\sqrt{\frac{h\upsilon}{(2m)}}$ (d) $\sqrt{\frac{h\upsilon}{m}}$ *(NEET 2013)*

9. A source of light is placed at a distance of 50 cm from a photo cell and the stopping potential is found to be V_0. If the distance between the light source and photo cell is made 25 cm, the new stopping potential will be :
(a) $V_0/2$ (b) V_0
(c) $4V_0$ (d) $2V_0$
(Karnataka NEET 2013)

10. The de-Broglie wavelength of neutrons in thermal equilibrium at temperature T is
(a) $\frac{3.08}{\sqrt{T}}$ Å (b) $\frac{0.308}{\sqrt{T}}$ Å
(c) $\frac{0.0308}{\sqrt{T}}$ Å (d) $\frac{30.8}{\sqrt{T}}$ Å
(Karnataka NEET 2013)

11. A 200 W sodium street lamp emits yellow light of wavelength 0.6 μm. Assuming it to be 25% efficient in converting electrical energy to light, the number of photons of yellow light it emits per second is
(a) 1.5×10^{20} (b) 6×10^{18}
(c) 62×10^{20} (d) 3×10^{19} *(Prelims 2012)*

12. Monochromatic radiation emitted when electron on hydrogen atom jumps from first excited to the ground state irradiates a photosensitive material. The stopping potential is measured to be 3.57 V. The threshold frequency of the material is
(a) 4×10^{15} Hz (b) 5×10^{15} Hz
(c) 1.6×10^{15} Hz (d) 2.5×10^{15} Hz
(Prelims 2012)

13. An α-particle moves in a circular path of radius 0.83 cm in the presence of a magnetic field of 0.25 Wb/m^2. The de Broglie wavelength associated with the particle will be
(a) 1 Å (b) 0.1 Å
(c) 10 Å (d) 0.01 Å
(Prelims 2012)

14. If the momentum of an electron is changed by P, then the de Broglie wavelength associated with it changes by 0.5%. The initial momentum of electron will be
(a) $200P$ (b) $400P$
(c) $\frac{P}{200}$ (d) $100P$ *(Mains 2012)*

15. Two radiations of photons energies 1 eV and 2.5 eV, successively illuminate a photosensitive metallic surface of work function 0.5 eV. The ratio of the maximum speeds of the emitted electrons is
(a) 1 : 4 (b) 1 : 2
(c) 1 : 1 (d) 1 : 5 *(Mains 2012)*

16. Photoelectric emission occurs only when the incident light has more than a certain minimum
(a) power (b) wavelength
(c) intensity (d) frequency
(Prelims 2011)

17. In the Davisson and Germer experiment, the velocity of electrons emitted from the electron gun can be increased by
(a) increasing the potential difference between the anode and filament
(b) increasing the filament current
(c) decreasing the filament current
(d) decreasing the potential difference between the anode and filament *(Prelims 2011)*

18. Light of two different frequencies whose photons have energies 1 eV and 2.5 eV respectively illuminate a metallic surface whose work function is 0.5 eV successively. Ratio of maximum speeds of emitted electrons will be
(a) 1 : 4 (b) 1 : 2
(c) 1 : 1 (d) 1 : 5 *(Prelims 2011)*

19. Electrons used in an electron microscope are accelerated by a voltage of 25 kV. If the voltage is increased to 100 kV then the de-Broglie wavelength associated with the electrons would
(a) increase by 2 times
(b) decrease by 2 times
(c) decrease by 4 times
(d) increase by 4 times *(Prelims 2011)*

20. In photoelectric emission process from a metal of work function 1.8 eV, the kinetic energy of most energetic electrons is 0.5 eV. The corresponding stopping potential is
(a) 1.8 V (b) 1.3 V
(c) 0.5 V (d) 2.3 V *(Prelims 2011)*

21. The threshold frequency for a photosensitive metal is 3.3×10^{14} Hz. If light of frequency 8.2×10^{14} Hz is incident on this metal, the cut-off voltage for the photoelectron emission is nearly

(a) 1 V (b) 2 V
(c) 3 V (d) 5 V *(Mains 2011)*

22. A beam of cathode rays is subjected to crossed electric (E) and magnetic fields (B). The fields are adjusted such that the beam is not deflected. The specific charge of the cathode rays is given by
(a) $\frac{B^2}{2VE^2}$ (b) $\frac{2VB^2}{E^2}$
(c) $\frac{2VE^2}{B^2}$ (d) $\frac{E^2}{2VB^2}$ *(Prelims 2010)*

(Where V is the potential difference between cathode and anode)

23. A source S_1 is producing, 10^{15} photons per second of wavelength 5000 Å. Another source S_2 is producing 1.02×10^{15} photons per second of wavelength 5100 Å. Then, (power of S_2)/(power of S_1) is equal to
(a) 1.00 (b) 1.02
(c) 1.04 (d) 0.98 *(Prelims 2010)*

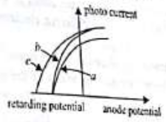
24. The potential difference that must be applied to stop the fastest photoelectrons emitted by a nickel surface, having work function 5.01 eV, when ultraviolet light of 200 nm falls on it, must be
(a) 2.4 V (b) −1.2 V
(c) −2.4 V (d) 1.2 V *(Prelims 2010)*

25. When monochromatic radiation of intensity I falls on a metal surface, the number of photoelectrons and their maximum kinetic energy are N and T respectively. If the intensity of radiation is $2I$, the number of emitted electrons and their maximum kinetic energy are respectively
(a) N and $2T$ (b) $2N$ and T
(c) $2N$ and $2T$ (d) N and T
(Mains 2010)

26. The electron in the hydrogen atom jumps from excited state ($n = 3$) to its ground state ($n = 1$) and the photons thus emitted irradiate a photosensitive material. If the work function of the material is 5.1 eV, the stopping potential is estimated to be (the energy of the electron in n^{th} state $E_n = \frac{-13.6}{n^2}$ eV)
(a) 5.1 V (b) 12.1 V
(c) 17.2 V (d) 7 V *(Mains 2010)*

27. The number of photo electrons emitted for light of a frequency υ (higher than the threshold frequency υ_0) is proportional to
(a) threshold frequency (υ_0)
(b) intensity of light
(c) frequency of light (υ)
(d) $\upsilon - \upsilon_0$
(Prelims 2009)

28. The figure shows a plot of photo current versus anode potential for a photo sensitive surface for three different radiations. Which one of the following is a correct statement?



(a) Curves (a) and (b) represent incident radiations of same frequency but of different intensities.
(b) Curves (b) and (c) represent incident radiations of different frequencies and different intensities.
(c) Curves (b) and (c) represent incident radiations of same frequency having same intensity.
(d) Curves (a) and (b) represent incident radiations of different frequencies and different intensities.
(Prelims 2009)

29. Monochromatic light of wavelength 667 nm is produced by a helium neon laser. The power emitted is 9 mW. The number of photons arriving per sec. on the average at a target irradiated by this beam is
(a) 3×10^{16} (b) 9×10^{15}
(c) 3×10^{19} (d) 9×10^{17}
(Prelims 2009)

30. The work function of a surface of a photosensitive material is 6.2 eV. The wavelength of the incident radiation for which the stopping potential is 5 V lies in the
(a) Infrared region
(b) X-ray region
(c) Ultraviolet region
(d) Visible region *(Prelims 2008)*

31. A particle of mass 1 mg has the same wavelength as an electron moving with a velocity of 3×10^6 ms^{-1}. The velocity of the particle is
(a) 3×10^{-31} ms^{-1} (b) 2.7×10^{-21} ms^{-1}
(c) 2.7×10^{-18} ms^{-1} (d) 9×10^{-2} ms^{-1}
(mass of electron = 9.1×10^{-31} kg)
(Prelims 2008)

32. In the phenomenon of electric discharge through gases at low pressure, the coloured glow in the tube appears as a result of
(a) collisions between the charged particles emitted from the cathode and the atoms of the gas
(b) collision between different electrons of the atoms of the gas
(c) excitation of electrons in the atoms
(d) collision between the atoms of the gas
(Prelims 2008)

33. A beam of electron passes undeflected through mutually perpendicular electric and magnetic fields. If the electric field is switched off, and the same magnetic field is maintained, the electrons move
(a) in a circular orbit
(b) along a parabolic path
(c) along a straight line
(d) in an elliptical orbit. *(2007)*

34. Monochromatic light of frequency 6.0×10^{14} Hz is produced by a laser. The power emitted is 2×10^{-3} W. The number of photons emitted, on the average, by the source per second is
(a) 5×10^{16} (b) 5×10^{17}
(c) 5×10^{14} (d) 5×10^{15}. *(2007)*

35. A 5 watt source emits monochromatic light of wavelength 5000 Å. When placed 0.5 m away, it liberates photoelectrons from a photosensitive metallic surface. When the source is moved to a distance of 1.0 m, the number of photoelectrons liberated will be reduced by a factor of
(a) 8 (b) 16
(c) 2 (d) 4. *(2007)*

36. A photocell employs photoelectric effect to convert
(a) change in the frequency of light into a change in the electric current
(b) change in the frequency of light into a change in electric voltage
(c) change in the intensity of illumination into a change in photoelectric current
(d) change in the intensity of illumination into a change in the work function of the photocathode.
(2006)

37. When photons of energy $h\upsilon$ fall on an aluminium plate (of work function E_0), photoelectrons of maximum kinetic energy K are ejected. If the frequency of radiation is doubled, the maximum kinetic energy of the ejected photoelectrons will be
(a) $K + h\upsilon$ (b) $K + E_0$
(c) $2K$ (d) K.
(2006)

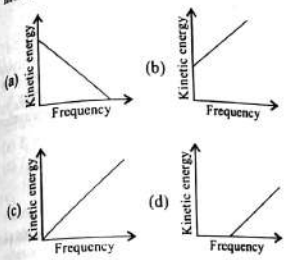
38. In a discharge tube ionization of enclosed gas is produced due to collisions between
(a) neutral gas atoms/molecules
(b) positive ions and neutral atoms/molecules
(c) negative electrons and neutral atoms/molecules
(d) photons and neutral atoms/molecules.
(2006)

39. The momentum of a photon of energy 1 MeV in kg m/s will be
(a) 5×10^{-22} (b) 0.33×10^6
(c) 7×10^{-24} (d) 10^{-22}. *(2006)*

40. The work functions for metals A, B and C are respectively 1.92 eV, 2.0 eV and 5 eV. According to Einstein's equation the metals which will emit photoelectrons for a radiation of wavelength 4100 Å is/are
(a) A only
(b) A and B only
(c) all the three metals
(d) none. *(2005)*

41. A photosensitive metallic surface has work function, $h\upsilon_0$. If photons of energy $2h\upsilon_0$ fall on this surface, the electrons come out with a maximum velocity of 4×10^6 m/s. When the photon energy is increased to $5h\upsilon_0$, then maximum velocity of photoelectrons will be
(a) 2×10^7 m/s (b) 2×10^6 m/s
(c) 8×10^6 m/s (d) 8×10^5 m/s. *(2005)*

42. According to Einstein's photoelectric equation, the graph between the kinetic energy of photoelectrons ejected and the frequency of incident radiation is



(2004, 1996)

43. A photoelectric cell is illuminated by a point source of light 1 m away. When the source is shifted to 2 m then
(a) each emitted electron carries one quarter of the initial energy
(b) number of electrons emitted is half the initial number
(c) each emitted electron carries half the initial energy
(d) number of electrons emitted is a quarter of the initial number
(2003)

44. J.J. Thomson's cathode-ray tube experiment demonstrated that
(a) cathode rays are streams of negatively charged ions
(b) all the mass of an atom is essentially in the nucleus
(c) the e/m of electrons is much greater than the e/m of protons
(d) the e/m ratio of the cathode-ray particles changes when a different gas is placed in the discharge tube *(2003)*

45. The value of Planck's constant is
(a) 6.63×10^{-34} J/sec.
(b) 6.63×10^{-34} kg-m^2/sec
(c) 6.63×10^{-34} kg-m^2 *(2002)*
(d) 6.63×10^{-34} J-sec.

46. If particles are moving with same velocity, then which has maximum de Broglie wavelength?
(a) proton (b) α-particle
(c) neutron (d) β-particle. *(2002)*

47. When ultraviolet rays incident on metal plate then photoelectric effect does not occur, it occurs by incidence of
(a) infrared rays (b) X-rays
(c) radio wave (d) micro wave. *(2002)*

48. Which of the following is not the property of cathode rays?
(a) It produces heating effect
(b) It does not deflect in electric field
(c) It casts shadow
(d) It produces fluorescence. *(2002)*

49. Which one among the following shows particle nature of light?
(a) photo electric effect (b) interference
(b) refraction (d) polarization.
(2001)

50. In Thomson mass spectrograph $\vec{E} \perp \vec{B}$ then the velocity of electron beam will be
(a) $\frac{|\vec{E}|}{|\vec{B}|}$ (b) $\vec{E} \times \vec{B}$
(c) $\frac{|\vec{B}|}{|\vec{E}|}$ (d) $\frac{\vec{E}^2}{\vec{B}^2}$. *(2001)*

51. A photo-cell is illuminated by a source of light, which is placed at a distance d from the cell. If the distance become $d/2$, then number of electrons emitted per second will be
(a) remain same (b) four times
(c) two times (d) one-fourth. *(2001)*

52. By photoelectric effect, Einstein proved
(a) $E = h\upsilon$ (b) K.E. $= \frac{1}{2}mv^2$
(c) $E = mc^2$ (d) $E = \frac{-Rhc^2}{n^2}$.
(2000)

53. Who evaluated the mass of electron indirectly with help of charge
(a) Thomson (b) Millikan
(c) Rutherford (d) Newton. *(2000)*

54. When a proton is accelerated through 1 V, then its kinetic energy will be
(a) 1 eV (b) 13.6 eV
(c) 1840 eV (d) 0.54 eV *(1999)*

55. The photoelectric work function for a metal surface is 4.125 eV. The cut-off wavelength for this surface is
(a) 3000 Å (b) 2062.5 Å
(c) 4125 Å (d) 6000 Å *(1999)*

56. As the intensity of incident light increases
(a) kinetic energy of emitted photoelectrons increases
(b) photoelectric current decreases
(c) photoelectric current increases
(d) kinetic energy of emitted photoelectrons decreases *(1999)*

57. In a photo-emissive cell, with exciting wavelength λ, the fastest electron has speed v. If the exciting wavelength is changed to $\frac{3\lambda}{4}$, the speed of the fastest emitted electron will be
(a) less than $v(4/3)^{1/2}$
(b) $v(4/3)^{1/2}$ (c) $v(3/4)^{1/2}$
(d) greater than $v(4/3)^{1/2}$ *(1998)*

58. Which of the following statement is correct?
(a) The photocurrent increases with intensity of light
(b) The stopping potential increases with increase of incident light
(c) The current in photocell increases with increasing frequency
(d) The photocurrent is proportional to the applied voltage. *(1997)*

59. The kinetic energy of an electron, which is accelerated in the potential difference of 100 volts, is
(a) 416.6 cal (b) 6.636 cal
(c) 1.602×10^{-17} J (d) 1.6×10^{4} J. *(1997)*

60. An electron beam has a kinetic energy equal to 100 eV. Find its wavelength associated with a beam, if mass of electron = 9.1×10^{-31} kg and 1 eV = 1.6×10^{-19} J/eV.
(Planck's constant = 6.6×10^{-34} Js)
(a) 24.6 Å (b) 0.12 Å
(c) 1.2 Å (d) 6.3 Å. *(1996)*

61. In a discharge tube at 0.02 mm, there is formation of
(a) Crooke's dark space
(b) Faraday's dark space
(c) both space partly
(d) none of these. *(1996)*

62. An electron of mass m and charge e is accelerated from rest through a potential difference V in vacuum. Its final velocity will be
(a) $\sqrt{\frac{2eV}{m}}$ (b) $\sqrt{\frac{eV}{m}}$
(c) $\frac{eV}{2m}$ (d) $\frac{eV}{m}$. *(1996)*

63. If a photon has velocity c and frequency υ, then which of the following represents its wavelength?
(a) $\frac{h\upsilon}{c^2}$ (b) $h\upsilon$
(c) $\frac{hc}{E}$ (d) $\frac{h\upsilon}{c}$. *(1996)*

64. The velocity of photons is proportional to (where υ = frequency)
(a) $1/\sqrt{\upsilon}$ (b) υ^2
(c) υ (d) $\sqrt{\upsilon}$. *(1996)*

65. An electron of mass m, when accelerated through a potential difference V, has de Broglie wavelength λ. The de Broglie wavelength associated with a proton of mass M accelerated through the same potential difference, will be
(a) $\lambda \frac{M}{m}$ (b) $\lambda \frac{m}{M}$
(c) $\lambda \sqrt{\frac{M}{m}}$ (d) $\lambda \sqrt{\frac{m}{M}}$. *(1995)*

66. If we consider electrons and photons of same wavelength, then they will have same
(a) momentum (b) angular momentum
(c) energy (d) velocity. *(1995)*

67. When light of wavelength 300 nm (nanometer) falls on a photoelectric emitter, photoelectrons are liberated. For another emitter, however, light of 600 nm wavelength is sufficient for creating photoemission. What is the ratio of the work functions of the two emitters?
(a) 1 : 2 (b) 2 : 1
(c) 4 : 1 (d) 1 : 4 *(1993)*

68. Number of ejected photoelectrons increases with increase
(a) in intensity of light
(b) in wavelegth of light
(c) in frequency of light
(d) never *(1993)*

69. Momentum of photon wavelength λ is
(a) $\frac{h\upsilon}{c}$ (b) zero
(c) $\frac{h\lambda}{c^2}$ (d) $\frac{h\lambda}{c}$ *(1993)*

70. The cathode of a photoelectric cell is changed such that the work function changes from W_1 to W_2 ($W_2 > W_1$). If the current before and after changes are I_1 and I_2, all other conditions remaining unchanged, then (assuming $h\upsilon > W_2$)
(a) $I_1 = I_2$ (b) $I_1 < I_2$
(c) $I_1 > I_2$ (d) $I_1 < I_2 < 2I_1$ *(1992)*

71. Photoelectric work function of a metal is 1 eV. Light of wavelength λ = 3000 Å falls on it. The photo electrons come out with a maximum velocity
(a) 10 metres/sec (b) 10^2 metres/ sec
(c) 10^4 metres/sec (d) 10^6 metres/sec *(1991)*

72. The wavelength of a 1 keV photon is 1.24×10^{-9} m. What is the frequency of 1 MeV photon?
(a) 1.24×10^{15} (b) 2.4×10^{20}
(c) 1.24×10^{18} (d) 2.4×10^{23} *(1991)*

73. An electron with (rest mass m_0) moves with a speed of 0.8 c. Its mass when it moves with this speed is
(a) m_0 (b) $\frac{m_0}{6}$
(c) $\frac{5m_0}{3}$ (d) $\frac{3m_0}{5}$ *(1991)*

74. A radio transmitter operates at a frequency 880 kHz and a power of 10 kW. The number of photons emitted per second is
(a) 1.72×10^{31} (b) 1.327×10^{25}
(c) 1.327×10^{37} (d) 1.327×10^{45} *(1990)*

75. The momentum of a photon of an electromagnetic radiation is 3.3×10^{-29} kg ms^{-1}. What is the frequency of the associated waves?
[$h = 6.6 \times 10^{-34}$ Js ; $c = 3 \times 10^8$ ms^{-1}]
(a) 1.5×10^{13} Hz (b) 7.5×10^{12} Hz
(c) 6×10^3 Hz (d) 3×10^3 Hz *(1990)*

76. Ultraviolet radiations of 6.2 eV falls on an aluminium surface. Kinetic energy of fastest electron emitted is (work function = 4.2 eV)
(a) 3.2×10^{-21} J (b) 3.2×10^{-19} J
(c) 7×10^{-25} J (d) 9×10^{-32} J *(1989)*

77. The de Broglie wave corresponding to a particle of mass m and velocity v has a wavelength associated with it
(a) $\frac{h}{mv}$ (b) hmv
(c) $\frac{mh}{v}$ (d) $\frac{m}{hv}$ *(1989)*

78. The energy of a photon of wavelength λ is
(a) $hc\lambda$ (b) $\frac{hc}{\lambda}$
(c) $\frac{\lambda}{hc}$ (d) $\frac{\lambda h}{c}$ *(1988)*

79. Thermions are
(a) protons (b) electrons
(c) photons (d) positrons *(1988)*

80. The threshold frequency for photoelectric effect on sodium corresponds to a wavelength of 5000 Å. Its work function is
(a) 4×10^{-19} J (b) 1 J
(c) 2×10^{-19} J (d) 3×10^{-19} J *(1988)*

EXPLANATIONS

1. **(c) :** Let ϕ_0 be the work function of the surface of the material. Then,
According to Einstein's photoelectric equation, the maximum kinetic energy of the emitted photoelectrons in the first case is

$$K_{max_1} = \frac{hc}{\lambda} - \phi_0$$

and that in the second case is

$$K_{max_2} = \frac{hc}{\frac{\lambda}{2}} - \phi_0 = \frac{2hc}{\lambda} - \phi_0$$

But $K_{max2} = 3K_{max1}$ (given)

$$\therefore \quad \frac{2hc}{\lambda} - \phi_0 = 3\left(\frac{hc}{\lambda} - \phi_0\right)$$

$$\frac{2hc}{\lambda} - \phi_0 = \frac{3hc}{\lambda} - 3\phi_0$$

$$3\phi_0 - \phi_0 = \frac{3hc}{\lambda} - \frac{2hc}{\lambda}$$

$$2\phi_0 = \frac{hc}{\lambda} \quad \text{or} \quad \phi_0 = \frac{hc}{2\lambda}$$

2. **(a) :** According to Einstein's photoelectric equation, the maximum kinetic energy of the emitted electron is

$$K_{max} = \frac{hc}{\lambda} - \phi_0$$

where λ is the wavelength of incident light and ϕ_0 is the work function.
Here, $\lambda = 500$ nm, $hc = 1240$ eV nm
and $\phi_0 = 2.28$ eV

$$\therefore \quad K_{max} = \frac{1240 \text{ eV nm}}{500 \text{ nm}} - 2.28 \text{ eV}$$

$$= 2.48 \text{ eV} - 2.28 \text{ eV} = 0.2 \text{ eV}$$

The de Broglie wavelength of the emitted electron is

$$\lambda_{min} = \frac{h}{\sqrt{2\, mK_{max}}}$$

where h is the Planck's constant and m is the mass of the electron.
As $h = 6.6 \times 10^{-34}$ J s, $m = 9 \times 10^{-31}$ kg
and $K_{max} = 0.2$ eV $= 0.2 \times 1.6 \times 10^{-19}$ J

$$\therefore \quad \lambda_{min} = \frac{6.6 \times 10^{-34} \text{ J s}}{\sqrt{2(9 \times 10^{-31} \text{ kg})(0.2 \times 1.6 \times 10^{-19} \text{ J})}}$$

$$= \frac{6.6}{2.4} \times 10^{-9} \text{ m} = 2.8 \times 10^{-9} \text{ m}$$

So, $\lambda \geq 2.8 \times 10^{-9}$ m

3. **(d) :** de-Broglie wavelength, $\lambda = \frac{h}{p}$
or $\lambda \propto \frac{1}{p}$, λp = constant
This represents a rectangular hyperbola.

4. **(d)**

5. **(b) :** According to Einstein's photoelectric equation,
The kinetic energy of emitted photoelectrons is
$K = h\upsilon - \phi_0$
where $h\upsilon$ is the energy of incident radiation and ϕ_0 is work function of the metal.
As per question,

$$0.5 \text{ eV} = h\upsilon - \phi_0 \qquad \text{...(i)}$$

$$0.8 \text{ eV} = 1.2h\upsilon - \phi_0 \qquad \text{...(ii)}$$

On solving eqns. (i) and (ii), we get
$\phi_0 = 1.0$ eV

6. **(b) :** de Broglie wavelength,

$$\lambda = \frac{h}{\sqrt{2mK}} \qquad \text{...(i)}$$

where m is the mass and K is the kinetic energy of the particle.
When kinetic energy of the particle is increased to 16 times, then its de Broglie wavelength becomes,

$$\lambda' = \frac{h}{\sqrt{2m(16K)}} = \frac{1}{4}\frac{\lambda}{\sqrt{2mK}} = \frac{\lambda}{4} \quad \text{(Using (i))}$$

% change in the de Broglie wavelength

$$= \frac{\lambda - \lambda'}{\lambda} \times 100 = \left(1 - \frac{\lambda'}{\lambda}\right) \times 100$$

$$= \left(1 - \frac{1}{4}\right) \times 100 = 75\%$$

7. **(c) :** Wavelength of an electron of energy E is

$$\lambda_e = \frac{h}{\sqrt{2m_e E}} \qquad \text{...(i)}$$

Wavelength of a photon of same energy E is

$$\lambda_p = \frac{hc}{E} \text{ or } E = \frac{hc}{\lambda_p} \qquad \text{...(ii)}$$

Squaring both sides of Eq. (i), we get

$$\lambda_e^2 = \frac{h^2}{2m_e E} \text{ or } E = \frac{h^2}{2m_e \lambda_e^2} \qquad \text{...(iii)}$$

Equating (ii) and (iii), we get

$$\frac{hc}{\lambda_p} = \frac{h^2}{2m_e \lambda_e^2}$$

$$\lambda_p = \frac{2m_e c}{h} \lambda_e^2$$

$$\lambda_p \propto \lambda_e^2$$

8. **(a) :** Work function, $\phi = h\upsilon$
According to Einstein's photoelectric equation

$$\frac{1}{2} mv_{max}^2 = h(2\upsilon) - h\upsilon$$

$$\frac{1}{2} mv_{max}^2 = h\upsilon$$

$$v_{max}^2 = \frac{2h\upsilon}{m}$$

$$v_{max} = \sqrt{\frac{2h\upsilon}{m}}$$

9. **(b) :** By changing the position of source of light from photocell, there will be a change in the intensity of light falling on photocell.
As stopping potential is independent of the intensity of the incident light, hence stopping potential remains same *i.e.*, V_0.

10. **(d) :** de Broglie wavelength of neutrons in thermal equilibrium at temperature T is

$$\lambda = \frac{h}{\sqrt{2mk_B T}}$$

where m is the mass of the neutron
k_B is the Boltzmann constant
h is the Planck's constant
Here, $m = 1.67 \times 10^{-27}$ kg
$k_B = 1.38 \times 10^{-23}$ J K^{-1}
$h = 6.63 \times 10^{-34}$ J s

$$\therefore \quad \lambda = \frac{6.63 \times 10^{-34}}{\sqrt{2 \times 1.67 \times 10^{-27} \times 1.38 \times 10^{-23} \times T}}$$

$$= \frac{3.08 \times 10^{-34} \times 10^{25}}{\sqrt{T}} \text{ m}$$

$$= \frac{30.8 \times 10^{-10}}{\sqrt{T}} = \frac{30.8}{\sqrt{T}} \text{ Å}$$

11. **(a) :** Energy of a photon,

$$= \frac{(6.6 \times 10^{-34} \text{ J s})(3 \times 10^8 \text{ m s}^{-1})}{0.6 \times 10^{-6} \text{ m}}$$

$$= 33 \times 10^{-20} \text{ J}$$

Number of photons emitted per second is

$$N = \frac{\frac{25}{100}P}{E} = \frac{\frac{25}{100} \times 200 \text{ W}}{33 \times 10^{-20} \text{ J}} = 1.5 \times 10^{20}$$

12. **(c) :** For hydrogen atom, $E_n = -\frac{13.6}{n^2}$ eV
For ground state, $n = 1$

$$\therefore \quad E_1 = -\frac{13.6}{1^2} = -13.6 \text{ eV}$$

For first excited state, $n = 2$

$$\therefore \quad E_2 = -\frac{13.6}{2^2} = -3.4 \text{ eV}$$

The energy of the emitted photon when an electron jumps from first excited state to ground state is
$h\upsilon = E_2 - E_1 = -3.4 \text{ eV} - (-13.6 \text{ eV}) = 10.2$ eV
Maximum kinetic energy,

$$K_{max} = eV_s = e \times 3.57 \text{ V} = 3.57 \text{ eV}$$

According to Einstein's photoelectric equation

$$K_{max} = h\upsilon - \phi_0$$

where ϕ_0 is the work function and $h\upsilon$ is the incident energy

$$\phi_0 = h\upsilon - K_{max} = 10.2 \text{ eV} - 3.57 \text{ eV} = 6.63 \text{ eV}$$

$$\text{Threshold frequency, } \upsilon_0 = \frac{\phi_0}{h} = \frac{6.63 \times 1.6 \times 10^{-19} \text{ J}}{6.63 \times 10^{-34} \text{ J s}}$$

$$= 1.6 \times 10^{15} \text{ Hz}$$

13. **(d) :** Radius of the circular path of a charged particle in a magnetic field is given by

$$R = \frac{mv}{Bq} \quad \text{or} \quad mv = RBq$$

Here, $R = 0.83$ cm $= 0.83 \times 10^{-2}$ m
$B = 0.25$ Wb m^{-2}
$q = 2e = 2 \times 1.6 \times 10^{-19}$ C
$\therefore \; mv = (0.83 \times 10^{-2})(0.25)(2 \times 1.6 \times 10^{-19})$

de Broglie wavelength,

$$\lambda = \frac{h}{mv} = \frac{6.6 \times 10^{-34}}{0.83 \times 10^{-2} \times 0.25 \times 2 \times 1.6 \times 10^{-19}}$$

$$= 0.01 \text{ Å}$$

14. (a) : de Broglie wavelength associated with an electron is

$$\lambda = \frac{h}{P} \quad \text{or} \quad P = \frac{h}{\lambda}$$

$$\therefore \quad \frac{\Delta P}{P} = -\frac{\Delta \lambda}{\lambda}$$

$$\frac{P}{P_{\text{initial}}} = \frac{0.5}{100}$$

$$P_{\text{initial}} = 200P$$

15. (b) : According to Einstein's photoelectric equation

$$\frac{1}{2} m v_{\max}^2 = h\upsilon - \phi_0$$

where $\frac{1}{2} m v_{\max}^2$ is the maximum kinetic energy of the emitted electrons, $h\upsilon$ is the incident energy and ϕ_0 is the work function of the metal.

$$\therefore \quad \frac{1}{2} m v_{\max_1}^2 = 1 \text{ eV} - 0.5 \text{ eV} = 0.5 \text{ eV} \quad \text{...(i)}$$

$$\text{and} \quad \frac{1}{2} m v_{\max_2}^2 = 2.5 \text{ eV} - 0.5 \text{ eV} = 2 \text{ eV} \quad \text{...(ii)}$$

Divide (i) and (ii), we get

$$\frac{v_{\max_1}^2}{v_{\max_2}^2} = \frac{0.5}{2}$$

$$\frac{v_{\max_1}}{v_{\max_2}} = \sqrt{\frac{0.5}{2}} = \frac{1}{2}$$

16. (d) : According to Einstein's photoelectric equation

$$K_{\max} = h\upsilon - h\upsilon_0$$

Since $K_{\max}$ is +ve, the photoelectric emission occurs only if

$$h\upsilon > h\upsilon_0 \quad \text{or} \quad \upsilon > \upsilon_0$$

The photoelectric emission occurs only when the incident light has more than a certain minimum frequency. This minimum frequency is called **threshold frequency**.

17. (a) : As stated.

18. (b) : Here, work function, $\phi_0 = 0.5$ eV

According to Einstein's photoelectric equation

Maximum kinetic energy of the emitted electrons = Incident photon energy − Work function

$$\therefore \quad K_{\max_1} = 1 \text{ eV} - 0.5 \text{ eV} = 0.5 \text{ eV} \quad \text{...(i)}$$

$$\text{and } K_{\max_2} = 2.5 \text{ eV} - 0.5 \text{ eV} = 2 \text{ eV} \quad \text{...(ii)}$$

Divide (i) by (ii), we get

$$\frac{K_{\max_1}}{K_{\max_2}} = \frac{0.5 \text{ eV}}{2 \text{ eV}} = \frac{1}{4}$$

$$\frac{\frac{1}{2} m v_{\max_1}^2}{\frac{1}{2} m v_{\max_2}^2} = \frac{1}{4} \quad \text{or} \quad \frac{v_{\max_1}}{v_{\max_2}} = \sqrt{\frac{1}{4}} = \frac{1}{2}$$

19. (b) : The de Broglie wavelength λ associated with the electrons is

$$\lambda = \frac{1.227}{\sqrt{V}} \text{ nm}$$

where V is the accelerating potential in volts.

$$\text{or} \quad \lambda \propto \frac{1}{\sqrt{V}}$$

$$\therefore \quad \frac{\lambda_1}{\lambda_2} = \sqrt{\frac{V_2}{V_1}} = \sqrt{\frac{100 \times 10^3}{25 \times 10^3}} = 2 \text{ or } \lambda_2 = \frac{\lambda_1}{2}$$

20. (c) : The stopping potential V_s is related to the maximum kinetic energy of the emitted electrons $K_{\max}$ through the relation

$$K_{\max} = eV_s$$

$$0.5 \text{ eV} = eV_s \quad \text{or} \quad V_s = 0.5 \text{ V}$$

21. (b) : According to Einstein's photoelectric equation

$$eV_0 = h\upsilon - h\upsilon_0$$

where, υ = Incident frequency

υ_0 = Threshold frequency

V_0 = Cut-off or stopping potential

$$\text{or} \quad V_0 = \frac{h}{e}(\upsilon - \upsilon_0)$$

Substituting the given values, we get

$$V_0 = \frac{6.63 \times 10^{-34}(8.2 \times 10^{14} - 3.3 \times 10^{14})}{1.6 \times 10^{-19}} = 2 \text{ V}$$

22. (d) : When a beam of cathode rays (or electrons) are subjected to crossed electric (E) and magnetic (B) fields, the beam is not deflected, if

Force on electron due to magnetic field = Force on electron due to electric field

$$Bev = eE \quad \text{...(i)}$$

$$\text{or} \quad v = \frac{E}{B}$$

If V is the potential difference between the anode and the cathode, then

$$\therefore \quad \frac{1}{2} mv^2 = eV$$

$$\frac{e}{m} = \frac{v^2}{2V} \quad \text{...(ii)}$$

Substituting the value of v from equation (i) in equation (ii), we get

$$\frac{e}{m} = \frac{E^2}{2VB^2}$$

Specific charge of the cathode rays $\frac{e}{m} = \frac{E^2}{2VB^2}$

23. (a) : For a source S_1,

Wavelength, $\lambda_1 = 5000$ Å

Number of photons emitted per second, $N_1 = 10^{15}$

Energy of each photon, $E_1 = \frac{hc}{\lambda_1}$

Power of source S_1, $P_1 = E_1 N_1$

$$= \frac{N_1 hc}{\lambda_1}$$

For a source S_2,

Wavelength, $\lambda_2 = 5100$ Å

Number of photons emitted per second, $N_2 = 1.02 \times 10^{15}$

Energy of each photon, $E_2 = \frac{hc}{\lambda_2}$

Power of source S_2, $P_2 = N_2 E_2 = \frac{N_2 hc}{\lambda_2}$

$$\therefore \quad \frac{\text{Power of } S_2}{\text{Power of } S_1} = \frac{P_2}{P_1} = \frac{\frac{N_2 hc}{\lambda_2}}{\frac{N_1 hc}{\lambda_1}} = \frac{N_2 \lambda_1}{N_1 \lambda_2}$$

$$= \frac{(1.02 \times 10^{15} \text{ photons/s}) \times (5000 \text{ Å})}{(10^{15} \text{ photons/s}) \times (5100 \text{ Å})} = \frac{51}{51} = 1$$

24. (b) : Here,

Incident wavelength, $\lambda = 200$ nm

Work function, $\phi_0 = 5.01$ eV

According to Einstein's photoelectric equation

$$eV_s = h\upsilon - \phi_0$$

$$eV_s = \frac{hc}{\lambda} - \phi_0$$

where V_s is the stopping potential

$$eV_s = \frac{(1240 \text{ eV nm})}{(200 \text{ nm})} - 5.01 \text{ eV}$$

$$= 6.2 \text{ eV} - 5.01 \text{ eV} = 1.2 \text{ eV}$$

Stopping potential, $V_s = 1.2$ V

The potential difference that must be applied to stop photoelectrons $= -V_s = -1.2$ V

25. (b) : The number of photoelectrons ejected is directly proportional to the intensity of incident light. Maximum kinetic energy is independent of intensity of incident light but depends upon the frequency of light. Hence option (b) is correct.

26. (d) : Energy released when electron in the atom jumps from excited state ($n = 3$) to ground state ($n = 1$) is

$$E = h\upsilon = E_3 - E_1 = \frac{-13.6}{3^2} - \left(\frac{-13.6}{1^2}\right)$$

$$= \frac{-13.6}{9} + 13.6 = 12.1 \text{ eV}$$

Therefore, stopping potential

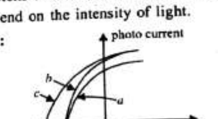
$$eV_0 = h\upsilon - \phi_0$$

$$= 12.1 - 5.1 \quad [\because \text{work function } \phi_0 = 5.1]$$

$$V_0 = 7 \text{ V}$$

27. (b) : The number of photoelectrons decide the photocurrent. Assuming that the number of electrons emitted depends on the number of photons incident, the number of photoelectrons depend on the intensity of light.

28. (a) :



(a) and (b) represent radiations of the same frequency because their kinetic energies are the same. But saturation photocurrents are different. Therefore intensities are different.

29. **(a)** : $\lambda = 6670$ Å.

$$E \text{ of a photon} = \frac{12400\,\text{eVÅ}}{6670\,\text{Å}} = \frac{12400}{6670} \times 1.6 \times 10^{-19}\ \text{J}.$$

Energy emitted per second, power $P = 9 \times 10^{-3}$ J

$$\therefore \text{ Number of photons incident} = \frac{\text{Power}}{\text{Energy}} = \frac{P}{E}$$

$$= \frac{9 \times 10^{-3} \times 6670}{12400 \times 1.6 \times 10^{-19}} = 3 \times 10^{16}.$$

30. **(c)** : $W_{es} = 6.2$ eV.

$Te_{max} = 5$ eV; $\therefore h\upsilon = 11.2$ eV

$$\therefore \lambda = \frac{hc}{E} = \frac{12400\,\text{eV.Å}}{11.2\,\text{eV}} = 1107\ \text{Å}$$

This wavelength is in the ultraviolet region.

31. **(c)** : $\lambda = \dfrac{h}{10^{-6}\,\text{kg} \times v} = \dfrac{h}{9.1 \times 10^{-31}\,\text{kg} \times 3 \times 10^{6}\,\text{m/s}}$

$\therefore v = 2.7 \times 10^{-18}$ m/s.

32. **(a)** : Collisions of the charged particles with the atoms in the gas.

33. **(a)** : Electron travelling in a magnetic field perpendicular to its velocity - circular path.

34. **(d)** : Power of monochromatic light beam is $P = Nh\upsilon$ where N is the number of photons emitted per second.

Power $P = 2 \times 10^{-3}$ W

Energy of one photon $E = h\upsilon$
$= 6.63 \times 10^{-34} \times 6 \times 10^{14}$ J

Number of photons emitted per second,
$N = P/E$

$$= \frac{2 \times 10^{-3}}{6.63 \times 10^{-34} \times 6 \times 10^{14}} = 0.05 \times 10^{17} = 5 \times 10^{15}.$$

35. **(d)** : For a light source of power P watt, the intensity at a distance d is given by

$$I = \frac{P}{4\pi d^2}$$

where we assume light to spread out uniformly in all directions *i.e.* it is a spherical source.

$$\therefore I \propto \frac{1}{d^2} \quad \text{or} \quad \frac{I_1}{I_2} = \frac{d_2^2}{d_1^2}$$

$$\text{or, } \frac{I_1}{I_2} = \left(\frac{1}{0.5}\right)^2 \quad \text{or, } \frac{I_1}{I_2} = 4 \quad \text{or, } I_2 = \frac{I_1}{4}.$$

In a photoelectric emission, the number of photoelectrons liberated per second from a photosensitive metallic surface is proportional to the intensity of the light. When a intensity of source is reduced by a factor of four, the number of photoelectrons is also reduced by a factor of 4.

36. **(c)** : The photoelectric current is directly proportional to the intensity of illumination. Therefore a change in the intensity of the incident radiation will change the photocurrent also.

37. **(a)** : Let K and K' be the maximum kinetic energy of photoelectrons for incident light of frequency υ and 2υ respectively.

According to Einstein's photoelectric equation,

$K = h\upsilon - E_0$ ...(i)

and $K' = h(2\upsilon) - E_0$ ...(ii)

$= 2h\upsilon - E_0 = h\upsilon + h\upsilon - E_0$

$K' = h\upsilon + K$ [using (i)]

38. **(c)**

39. **(a)** : Energy of photon $E = 1$ MeV

Momentum of photon $p = E/c$

$$\therefore p = \frac{E}{c} = \frac{1 \times 10^6 \times 1.6 \times 10^{-19}\ \text{J}}{3 \times 10^8\ \text{ms}^{-1}} = 0.53 \times 10^{-21}$$
$$\approx 5 \times 10^{-22}\ \text{kg m/s}.$$

40. **(b)** :

	A	B	C
	1.92 eV	2.0 eV	5.0 eV

$$E = \frac{hc}{\lambda} = \frac{6.63 \times 10^{-34} \times 3 \times 10^8}{41 \times 10^{-8}}$$

$$= \frac{19.89 \times 10^{-18}}{41 \times 1.6 \times 10^{-19}}\ \text{eV}$$

$$E = \frac{19.89 \times 10}{41 \times 1.6} = \frac{198.9}{65.6}\ \text{eV}$$

As energy of incident radiation is nearly equal to 3.0 eV, thus it only able to emit photoelectron from A and B which having work functions 1.92 eV and 2.0 eV respectively.

41. **(c)** : K.E. $= h\upsilon - W$

i.e. $\frac{1}{2}mv^2_{max} = h\upsilon - W$

$$\Rightarrow \frac{1}{2}m \times (4 \times 10^6)^2 = 2h\upsilon_0 - h\upsilon_0$$

$$\text{or, } \frac{1}{2}m \times (4 \times 10^6)^2 = h\upsilon_0$$

Another case, $2h\upsilon_0 \to 5h\upsilon_0$

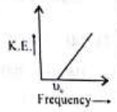
$$\frac{1}{2}mv^2_{max} = 4h\upsilon_0$$

$$\Rightarrow \frac{1}{2}mv^2_{max} = 4 \times \frac{1}{2} \times m \times (4 \times 10^6)^2$$

$$\Rightarrow v^2_{max} = 64 \times 10^{12} \Rightarrow v_{max} = 8 \times 10^6\ \text{m/s}.$$

42. **(d)** : The maximum kinetic energy of photoelectron ejected is given by

$K.E. = h\upsilon - W$
$= h\upsilon - h\upsilon_0$



where work function depends on the type of material.

If the frequency of incident radiation is greater than υ_0 only then the ejection of photoelectrons start. After that as frequency increases kinetic energy also increases.

43. **(d)** : Photoelectric current $I \propto$ intensity of light and

$$\text{intensity} \propto \frac{1}{(\text{distance})^2}$$

$$\therefore I \propto \frac{1}{(\text{distance})^2}.$$

44. **(c)**

45. **(d)** : The value of Planck's constant is 6.63×10^{-34} J-sec.

46. **(d)** : de Broglie wavelength for a particle is given by $\lambda = \frac{h}{p} = \frac{h}{mv}$, where m, v and p are the mass, velocity and momentum respectively. h is Planck's constant. Now, since all the particles are moving with same velocity, the particle with least mass will have maximum de-Broglie wavelength. Out of the given four particles (proton, α-particles, *i.e.* He nucleus and β-particles, *i.e.* electrons) β-particles has the lowest mass and therefore it has maximum wavelength.

47. **(b)** : Alkali metals, viz, lithium, sodium, potassium shows photoelectric effect even with visible light. Photo-electric emission depends on the work function (W) of the metal surface. If the frequency υ of the incident ray is less than certain frequency υ_0 known as threshold frequency, no photoelectric effect is possible. $W = h\upsilon_0$, is different for different materials.

Therefore, when ultra-violet rays fail to emit photo-electrons, rays like X-rays with higher frequency should be used.

48. **(b)** : Cathode rays are basically negatively charged particles (electrons). If the cathode rays are allowed to pass between two plates kept at a difference of potential, the rays are found to be deflected from the rectilinear path. The direction of deflection shows that the rays carry negative charges.

49. **(a)**

50. **(a)** $eE = evB \quad \therefore v = \frac{|E|}{|B|}$

51. **(b)** : Intensity becomes 4 times. So number increases.

52. **(a)** **53.** **(a)**

54. **(a)** : K.E. $= 1.6 \times 10^{-19} \times 1 = 1$ eV.

55. **(a)** : $\phi = h\upsilon = \frac{hc}{\lambda}$

$$\Rightarrow \lambda = \frac{hc}{\phi} = \frac{1242\ \text{eV. nm}}{4.125} \approx 3000\ \text{Å}$$

56. **(c)** : If the intensity of light of a given frequency is increased, then the number of photons striking the surface per second will increase in the same ratio. This increased number of photons strikes more electrons of metals and hence number of photolectrons emitted through the surface increase and hence photoelectric current increases.

57. **(d)** : According to Einstein's photoelectric equation,

$$\frac{1}{2}mv^2 = \frac{hc}{\lambda} - W_0 \quad \text{or,} \quad \frac{hc}{\lambda} = \frac{1}{2}mv^2 + W_0$$

and $\frac{1}{2}mv_1^2 = \frac{hc}{3\lambda/4} - W_0 = \frac{4}{3}\left(\frac{1}{2}mv^2 + W_0\right) - W_0$

So, v_1 is greater than $v(4/3)^{1/2}$.

58. **(a)** : Since the emission of photoelectrons is directly proportional to the intensity of the incident light, therefore photocurrent increases with the intensity of light.

59. **(c)** : Potential difference (V) = 100 volts.
Kinetic energy of an electron (K.E.)
$= eV = (1.6 \times 10^{-19}) \times 100 = 1.6 \times 10^{-17}$ joule.

60. **(c)** : Kinetic energy (E) = 100 eV;
Mass of electron $(m) = 9.1 \times 10^{-31}$ kg;
1 eV = 1.6×10^{-19} J and
Planck's constant $(h) = 6.6 \times 10^{-34}$ J-s.
Energy of an electron $(E) = 100 \times (1.6 \times 10^{-19})$ J

$$\text{or } \lambda = \frac{h}{\sqrt{2mE}} = \frac{6.6\times10^{-34}}{\sqrt{2\times9.1\times10^{-31}\times100\times1.6\times10^{-19}}}$$
$= 1.2 \times 10^{-10}$ m = 1.2 Å.

61. **(a)**

62. **(a)** : The kinetic energy of an electron

$$\frac{1}{2}\times mv^2 = eV$$

or final velocity of electron $(v) = \sqrt{\frac{2eV}{m}}$.

63. **(c)** : Energy of the photon $E = \frac{hc}{\lambda}$ or $\lambda = \frac{hc}{E}$, where λ is the wavelength.

64. **(*)** : The velocity of a photon in vacuum is a constant. $c = \upsilon\lambda$. But c = constant and one cannot say that it is proportional to υ or λ but only $c = \upsilon\lambda$.
In media, for a particular medium, υ remain the same, velocity changes. Therefore λ changes. The question is wrong.

65. **(d)** : Momentum of electrons $(p_e) = \sqrt{2meV}$ and momentum for proton $(p_p) = \sqrt{2MeV}$

Therefore, $\frac{\lambda_p}{\lambda_e} = \frac{h/p_p}{h/p_e} = \frac{p_e}{p_p} = \frac{\sqrt{2meV}}{\sqrt{2MeV}} = \sqrt{\left(\frac{m}{M}\right)}$.

Therefore $\lambda_p = \lambda\sqrt{\left(\frac{m}{M}\right)}$.

66. **(a)** : Wavelength $(\lambda) = \frac{h}{mv} = \frac{h}{p}$. Therefore for same wavelength of electrons and photons, the momentum should be same.

67. **(b)** : $W_0 = \frac{hc}{\lambda_0}$ or $W_0 \propto \frac{1}{\lambda_0}$;

$$\Rightarrow \frac{W_1}{W_2} = \frac{\lambda_2}{\lambda_1} = \frac{600}{300} = 2$$

68. **(a)** : Photoelectric current is directly proportional to the intensity of incident light.

69. **(a)** : Momentum of the photon = $\frac{h\upsilon}{c}$

70. **(a)** : The work function has no effect on photoelectric current so long as $h\upsilon > W_0$. The photoelectric current is proportional to the intensity of incident light. Since there is no change in the intensity of light, hence $I_1 = I_2$.

71. **(d)** : $h\upsilon = W + \frac{1}{2}mv^2$ or $\frac{hc}{\lambda} = W + \frac{1}{2}mv^2$

Here λ = 3000 Å = 3000×10^{-10} m
and W = 1 eV = 1.6×10^{-19} joule

$$\therefore \frac{(6.6\times10^{-34})(3\times10^8)}{3000\times10^{-10}}$$
$$= (1.6\times10^{-19}) + \frac{1}{2}\times(9.1\times10^{-31})v^2$$

Solving we get $v \cong 10^6$ m/s

72. **(b)** : Here, $\frac{hc}{\lambda} = 10^3$ eV and $h\upsilon = 10^6$ eV

Hence, $\upsilon = \frac{10^3 c}{\lambda} = \frac{10^3\times3\times10^8}{1.24\times10^{-9}}$
$= 2.4 \times 10^{20}$ Hz

73. **(c)** : $m = \frac{m_0}{\sqrt{1-\frac{v^2}{c^2}}} = \frac{m_0}{\sqrt{\frac{c^2-(0.8c)^2}{c^2}}} = \frac{5m_0}{3}$

74. **(a)** : No. of photons emitted per sec,

$$n = \frac{\text{Power}}{\text{Energy of photon}}$$
$$= \frac{P}{h\upsilon} = \frac{10000}{6.6\times10^{-34}\times880\times10^3}$$
$= 1.72 \times 10^{31}$

75. (a) : Momentum of the photon = $\frac{h\upsilon}{c}$

$$\Rightarrow \frac{c}{\upsilon} = \frac{h}{p} = \lambda$$
$$\upsilon = \frac{c}{\lambda} = \frac{cp}{h} = 3\times10^8\times\frac{3.3\times10^{-29}}{6.6\times10^{-34}}$$
$= 1.5 \times 10^{13}$ Hz
where, υ = frequency of radiation

76. **(b)** : Kinetic energy of fastest electron
$= E - W_0 = 6.2 - 4.2 = 2.0$ eV
$= 2 \times 1.6 \times 10^{-19} = 3.2 \times 10^{-19}$ J

77. **(a)** : de Broglie wavelength, $\lambda = \frac{h}{p} = \frac{h}{mv}$.

78. **(b)** : Energy of a photon $E = h\upsilon = \frac{hc}{\lambda}$.

79. **(b)** : When a metal is heated, electrons are ejected out of it, which are called thermions.

80. **(a)** : $W_0 = \frac{hc}{\lambda_0} = \frac{6.63\times10^{-34}\times3\times10^8}{5000\times10^{-10}} = 4\times10^{-19}$ J

CHAPTER

20 Atoms and Nuclei

1. A nucleus of uranium decays at rest into nuclei of thorium and helium. Then
   (a) The helium nucleus has more momentum than the thorium nucleus.
   (b) The helium nucleus has less kinetic energy than the thorium nucleus.
   (c) The helium nucleus has more kinetic energy than the thorium nucleus.
   (d) The helium nucleus has less momentum than the thorium nucleus.

   (AIPMT 2015)

2. In the spectrum of hydrogen, the ratio of the longest wavelength in the Lyman series to the longest wavelength in the Balmer series is
   (a) $\frac{27}{5}$ (b) $\frac{5}{27}$
   (c) $\frac{4}{9}$ (d) $\frac{9}{4}$

   (AIPMT 2015)

3. If radius of the $^{27}_{13}Al$ nucleus is taken to be R_{Al}, then the radius of $^{125}_{53}Te$ nucleus is nearly
   (a) $\frac{3}{5}R_{Al}$ (b) $\left(\frac{13}{53}\right)^{1/3} R_{Al}$
   (c) $\left(\frac{53}{13}\right)^{1/3} R_{Al}$ (d) $\frac{5}{3}R_{Al}$

   (AIPMT 2015, Cancelled)

4. Consider 3rd orbit of He^+ (Helium), using non-relativistic approach, the speed of electron in this orbit will be [given $K = 9 \times 10^9$ constant, $Z = 2$ and h (Planck's Constant) $= 6.6 \times 10^{-34}$ J s]
   (a) 0.73×10^6 m/s (b) 3.0×10^8 m/s
   (c) 2.92×10^6 m/s (d) 1.46×10^6 m/s

   (AIPMT 2015, Cancelled)

5. Hydrogen atom in ground state is excited by a monochromatic radiation of $\lambda = 975$ Å. Number of spectral lines in the resulting spectrum emitted will be
   (a) 3 (b) 2
   (c) 6 (d) 10

   (AIPMT 2014)

6. The binding energy per nucleon of and nuclei are 5.60 MeV and 7.06 MeV respectively. In the nuclear reaction

   $$^{7}_{3}Li + ^{1}_{1}H \rightarrow ^{4}_{2}He + ^{4}_{2}He + Q$$

   the value of energy Q released is
   (a) 19.6 MeV (b) −2.4 MeV
   (c) 8.4 MeV (d) 17.3 MeV

   (AIPMT 2014)

7. A radioisotope X with a half life 1.4×10^9 years decays to Y which is stable. A sample of the rock from a cave was found to contain X and Y in the ratio 1 : 7. The age of the rock is
   (a) 1.96×10^9 years (b) 3.92×10^9 years
   (c) 4.20×10^9 years (d) 8.40×10^9 years

   (AIPMT 2014)

8. Ratio of longest wave lengths corresponding to Lyman and Balmer series in hydrogen spectrum is
   (a) $\frac{7}{29}$ (b) $\frac{9}{31}$
   (c) $\frac{5}{27}$ (d) $\frac{3}{23}$ *(NEET 2013)*

9. A certain mass of Hydrogen is changed to Helium by the process of fusion. The mass defect in fusion reaction is 0.02866 u. The energy liberated per u is (given 1 u = 931 MeV)
   (a) 6.675 MeV (b) 13.35 MeV
   (c) 2.67 MeV (d) 26.7 MeV

   (NEET 2013)

10. The half life of a radioactive isotope 'X' is 20 years. It decays to another element 'Y' which is stable. The two elements 'X' and 'Y' were found to be in the ratio 1 : 7 in a sample of a given rock. The age of the rock is estimated to be
    (a) 80 years (b) 100 years
    (c) 40 years (d) 60 years

    (NEET 2013)

11. How does the Binding Energy per nucleon vary with the increase in the number of nucleons?
    (a) Decrease continuously with mass number.
    (b) First decreases and then increases with increase in mass number.
    (c) First increases and then decreases with increase in mass number.
    (d) Increases continuously with mass number.

    (Karnataka NEET 2013)

12. An electron in hydrogen atom makes a transition $n_1 \rightarrow n_2$ where n_1 and n_2 are principal quantum numbers of the two states. Assuming Bohr's model to be valid, the time period of the electron in the initial state is eight times that in the final state. The possible values of n_1 and n_2 are
    (a) $n_1 = 6$ and $n_2 = 2$ (b) $n_1 = 8$ and $n_2 = 1$
    (c) $n_1 = 8$ and $n_2 = 2$ (d) $n_1 = 4$ and $n_2 = 2$

    (Karnataka NEET 2013)

13. α-particles, β-particles and γ-rays are all having same energy. Their penetrating power in a given medium in increasing order will be
    (a) γ, α, β (b) α, β, γ
    (c) β, α, γ (d) β, γ, α

    (Karnataka NEET 2013)

14. Electron in hydrogen atom first jumps from third excited state to second excited state and then from second excited to the first excited state. The ratio of the wavelengths $\lambda_1 : \lambda_2$ emitted in the two cases is
    (a) $\frac{7}{5}$ (b) $\frac{27}{20}$
    (c) $\frac{27}{5}$ (d) $\frac{20}{7}$

    (Prelims 2012)

15. If the nuclear radius of ^{27}Al is 3.6 fermi, the approximate nuclear radius of ^{64}Cu in fermi is
    (a) 2.4 (b) 1.2
    (c) 4.8 (d) 3.6 *(Prelims 2012)*

16. A mixture consists of two radioactive materials A_1 and A_2 with half lives of 20 s and 10 s respectively. Initially the mixture has 40 g of A_1 and 160 g of A_2. The amount of the two in the mixture will become equal after
    (a) 60 s (b) 80 s
    (c) 20 s (d) 40 s

    (Prelims 2012)

17. An electron of a stationary hydrogen atom passes from the fifth energy level to the ground level. The velocity that the atom acquired as a result of photon emission will be
    (a) $\frac{24hR}{25m}$ (b) $\frac{25hR}{24m}$
    (c) $\frac{25m}{24hR}$ (d) $\frac{24m}{25hR}$

    (Prelims 2012)

    (m is the mass of the electron, R, Rydberg constant and h Planck's constant)

18. The transition from the state $n = 3$ to $n = 1$ in a hydrogen like atom results in ultraviolet radiation. Infrared radiation will be obtained in the transition from
    (a) $2 \rightarrow 1$ (b) $3 \rightarrow 2$
    (c) $4 \rightarrow 2$ (d) $4 \rightarrow 3$

    (Mains 2012)

19. The half life of a radioactive nucleus is 50 days. The time interval $(t_2 - t_1)$ between the time t_2 when $\frac{2}{3}$ of it has decayed and the time t_1 when $\frac{1}{3}$ of it had decayed is
    (a) 30 days (b) 50 days
    (c) 60 days (d) 15 days

    (Mains 2012)

20. The wavelength of the first line of Lyman series for hydrogen atom is equal to that of the second line of Balmer series for a hydrogen like ion. The atomic number Z of hydrogen like ion is
    (a) 3 (b) 4
    (c) 1 (d) 2 *(Prelims 2011)*

21. The half life of a radioactive isotope X is 50 years. It decays to another element Y which is stable. The two elements X and Y were found to be in the

ratio of 1 : 15 in a sample of a given rock. The age of the rock was estimated to be

(a) 150 years (b) 200 years
(c) 250 years (d) 100 years

(Prelims 2011)

22. The power obtained in a reactor using U^{235} disintegration is 1000 kW. The mass decay of U^{235} per hour is

(a) 10 microgram (b) 20 microgram
(c) 40 microgram (d) 1 microgram

(Prelims 2011)

23. A radioactive nucleus of mass M emits a photon of frequency υ and the nucleus recoils. The recoil energy will be

(a) $Mc^2 - h\upsilon$ (b) $h^2\upsilon^2/2Mc^2$
(c) zero (d) $h\upsilon$ *(Prelims 2011)*

24. A nucleus $^{m}_{n}X$ emits one α particle and two β^- particles. The resulting nucleus is

(a) $^{m-6}_{n-4}Z$ (b) $^{m-6}_{n}Z$
(c) $^{m-4}_{n}X$ (d) $^{m-4}_{n-2}Y$

(Prelims 2011)

25. Fusion reaction takes place at high temperature because

(a) nuclei break up at high temperature
(b) atoms get ionised at high temperature
(c) kinetic energy is high enough to overcome the coulomb repulsion between nuclei
(d) molecules break up at high temperature

(Prelims 2011)

26. An electron in the hydrogen atom jumps from excited state n to the ground state. The wavelength so emitted illuminates a photosensitive material having work function 2.75 eV. If the stopping potential of the photoelectron is 10 V, then the value of n is

(a) 2 (b) 3
(c) 4 (d) 5 *(Mains 2011)*

27. Two radioactive nuclei P and Q, in a given sample decay into a stable nucleus R. At time $t = 0$, number of P species are $4N_0$ and that of Q are N_0. Half-life of P (for conversion to R) is 1 minute where as that of Q is 2 minutes. Initially there are no nuclei of R present in the sample. When number of nuclei of P and Q are equal, the number of nuclei of R present in the sample would be

(a) $2N_0$ (b) $3N_0$
(c) $\frac{9N_0}{2}$ (d) $\frac{5N_0}{2}$ *(Mains 2011)*

28. Out of the following which one is not a possible energy for a photon to be emitted by hydrogen atom according to Bohr's atomic model?

(a) 0.65 eV (b) 1.9 eV
(c) 11.1 eV (d) 13.6 eV

(Mains 2011)

29. The mass of a $^{7}_{3}Li$ nucleus is 0.042 u less than the sum of the masses of all its nucleons. The binding energy per nucleon of $^{7}_{3}Li$ nucleus is nearly

(a) 46 MeV (b) 5.6 MeV
(c) 3.9 MeV (d) 23 MeV

(Prelims 2010)

30. The activity of a radioactive sample is measured as N_0 counts per minute at $t = 0$ and N_0/e counts per minute at $t = 5$ minutes. The time (in minutes) at which the activity reduces to half its value is

(a) $\log_e \frac{2}{5}$ (b) $\frac{5}{\log_e 2}$
(c) $5\log_{10} 2$ (d) $5\log_e 2$

(Prelims 2010)

31. The energy of a hydrogen atom in the ground state is −13.6 eV. The energy of a He^+ ion in the first excited state will be

(a) −13.6 eV (b) −27.2 eV
(c) −54.4 eV (d) −6.8 eV

(Prelims 2010)

32. An alpha nucleus of energy $\frac{1}{2}mv^2$ bombards a heavy nuclear target of charge Ze. Then the distance of closest approach for the alpha nucleus will be proportional to

(a) $\frac{1}{Ze}$ (b) v^2
(c) $\frac{1}{m}$ (d) $\frac{1}{v^4}$

(Prelims 2010)

33. The decay constant of a radio isotope is λ. If A_1 and A_2 are its activities at times t_1 and t_2 respectively, the number of nuclei which have decayed during the time $(t_1 - t_2)$

(a) $A_1t_1 - A_2t_2$ (b) $A_1 - A_2$
(c) $(A_1 - A_2)/\lambda$ (d) $\lambda(A_1 - A_2)$

(Mains 2010)

34. The binding energy per nucleon in deuterium and helium nuclei are 1.1 MeV and 7.0 MeV, respectively. When two deuterium nuclei fuse to form a helium nucleus the energy released in the fusion is

(a) 23.6 MeV (b) 2.2 MeV
(c) 28.0 MeV (d) 30.2 MeV

(Mains 2010)

35. In the nuclear decay given below

$$^{A}_{Z}X \rightarrow {}^{A}_{Z+1}Y \rightarrow {}^{A-4}_{Z-1}B^* \rightarrow {}^{A-4}_{Z-1}B,$$

the particles emitted in the sequence are

(a) γ, β, α (b) β, γ, α
(c) α, β, γ (d) β, α, γ

(Prelims 2009, 1993)

36. The number of beta particles emitted by a radioactive substance is twice the number of alpha particles emitted by it. The resulting daughter is an

(a) isomer of parent (b) isotone of parent
(c) isotope of parent (d) isobar of parent

(Prelims 2009)

37. In a Rutherford scattering experiment when a projectile of charge z_1 and mass M_1 approaches a target nucleus of charge z_2 and mass M_2, the distance of closest approach is r_0. The energy of the projectile is

(a) directly proportional to z_1z_2
(b) inversely proportional to z_1
(c) directly proportional to mass M_1
(d) directly proportional to $M_1 \times M_2$

(Prelims 2009)

38. The ionization energy of the electron in the hydrogen atom in its ground state is 13.6 eV. The atoms are excited to higher energy levels to emit radiations of 6 wavelengths. Maximum wavelength of emitted radiation corresponds to the transition between

(a) $n = 3$ to $n = 1$ states
(b) $n = 2$ to $n = 1$ states
(c) $n = 4$ to $n = 3$ states
(d) $n = 3$ to $n = 2$ states *(Prelims 2009)*

39. If $M(A; Z)$, M_p and M_n denote the masses of the nucleus $^{A}_{Z}X$, proton and neutron respectively in units of u (1 u = 931.5 MeV/c^2) and BE represents its bonding energy in MeV, then

(a) $M(A, Z) = ZM_p + (A - Z)M_n - BE$
(b) $M(A, Z) = ZM_p + (A - Z)M_n + BE/c^2$
(c) $M(A, Z) = ZM_p + (A - Z)M_n - BE/c^2$
(d) $M(A, Z) = ZM_p + (A - Z)M_n + BE$

(Prelims 2008)

40. Two nuclei have their mass numbers in the ratio of 1 : 3. The ratio of their nuclear densities would be

(a) $(3)^{1/3} : 1$ (b) 1 : 1
(c) 1 : 3 (d) 3 : 1 *(Prelims 2008)*

41. The ground state energy of hydrogen atom is −13.6 eV. When its electron is in the first excited state, its excitation energy is

(a) 10.2 eV (b) 0
(c) 3.4 eV (d) 6.8 eV

(Prelims 2008)

42. Two radioactive materials X_1 and X_2 have decay constants 5λ and λ respectively. If initially they have the same number of nuclei, then the ratio of the number of nuclei of X_1 to that X_2 will be $1/e$ after a time

(a) $1/4\lambda$ (b) e/λ
(c) λ (d) $\frac{1}{2}\lambda$ *(Prelims 2008)*

43. Two radioactive substances A and B have decay constants 5λ and λ respectively. At $t = 0$ they have the same number of nuclei. The ratio of number of nuclei of A to those of B will be $(1/e)^2$ after a time interval

(a) 4λ (b) 2λ
(c) $1/2\lambda$ (d) $1/4\lambda$ *(2007)*

44. In a radioactive decay process, the negatively charged emitted β-particles are
(a) the electrons produced as a result of the decay of neutrons inside the nucleus
(b) the electrons produced as a result of collisions between atoms
(c) the electrons orbiting around the nucleus
(d) the electrons present inside the nucleus. *(2007)*

45. In a mass spectrometer used for measuring the masses of ions, the ions are initially accelerated by an electric potential V and then made to describe semicircular paths of radius R using a magnetic field B. If V and B are kept constant, the ratio $\left(\frac{\text{charge on the ion}}{\text{mass of the ion}}\right)$ will be proportional to
(a) $1/R^2$ (b) R^2
(c) R (d) $1/R$. *(2007)*

46. A nucleus ^A_ZX has mass represented by $M(A, Z)$. If M_p and M_n denote the mass of proton and neutron respectively and B.E. the binding energy in MeV, then
(a) B.E. = $[ZM_p + (A - Z)M_n - M(A, Z)]c^2$
(b) B.E. = $[ZM_p + AM_n - M(A, Z)]c^2$
(c) B.E. = $M(A, Z) - ZM_p - (A - Z)M_n$
(d) B.E. = $[M(A, Z) - ZM_p - (A - Z)M_n]c^2$. *(2007)*

47. If the nucleus $^{27}_{13}Al$ has a nuclear radius of about 3.6 fm, then $^{125}_{32}Te$ would have its radius approximately as
(a) 9.6 fm (b) 12.0 fm
(c) 4.8 fm (d) 6.0 fm. *(2007)*

48. The total energy of electron in the ground state of hydrogen atom is –13.6 eV. The kinetic energy of an electron in the first excited state is
(a) 6.8 eV (b) 13.6 eV
(c) 1.7 eV (d) 3.4 eV. *(2007)*

49. Ionization potential of hydrogen atom is 13.6 eV. Hydrogen atoms in the ground state are excited by monochromatic radiation of photon energy 12.1 eV. According to Bohr's theory, the spectral lines emitted by hydrogen will be
(a) one (b) two
(c) three (d) four. *(2006)*

50. In a radioactive material the activity at time t_1 is R_1 and at a later time t_2, it is R_2. If the decay constant of the material is λ, then
(a) $R_1 = R_2$ (b) $R_1 = R_2e^{-\lambda(t_1-t_2)}$
(c) $R_1 = R_2e^{\lambda(t_1-t_2)}$ (d) $R_1 = R_2(t_2/t_1)$. *(2006)*

51. The binding energy of deuteron is 2.2 MeV and that of ^4_2He is 28 MeV. If two deuterons are fused to form one ^4_2He then the energy released is
(a) 30.2 MeV (b) 25.8 MeV
(c) 23.6 MeV (d) 19.2 MeV. *(2006)*

52. The radius of germanium (Ge) nuclide is measured to be twice the radius of ^9_4Be. The number of nucleons in Ge are
(a) 72 (b) 73
(c) 74 (d) 75. *(2006)*

53. In the reaction $^2_1H + ^3_1H \rightarrow ^4_2He + ^1_0n$, if the binding energies of ^2_1H, ^3_1H and ^4_2He are respectively a, b and c (in MeV), then the energy (in MeV) released in this reaction is
(a) $a + b + c$ (b) $a + b - c$
(c) $c - a - b$ (d) $c + a - b$. *(2005)*

54. The total energy of an electron in the first excited state of hydrogen atom is about – 3.4 eV. Its kinetic energy in this state is
(a) 3.4 eV (b) 6.8 eV
(c) – 3.4 eV (d) – 6.8 eV. *(2005)*

55. Which one of the following pairs of nuclei are isotones?
(a) $_{34}Se^{74}$, $_{31}Ga^{71}$ (b) $_{38}Sr^{84}$, $_{38}Sr^{86}$
(c) $_{42}Mo^{92}$, $_{40}Zr^{92}$ (d) $_{20}Ca^{40}$, $_{16}S^{32}$. *(2005)*

56. In any fission process the ratio $\frac{\text{mass of fission products}}{\text{mass of parent nucleus}}$ is
(a) equal to 1 (b) greater than 1
(c) less than 1
(d) depends on the mass of the parent nucleus. *(2005)*

57. Energy levels A, B and C of a certain atom corresponding to increasing values of energy *i.e.* $E_A < E_B < E_C$. If λ_1, λ_2 and λ_3 are wavelengths of radiations corresponding to transitions C to B, B to A and C to A respectively, which of the following relations is correct?
(a) $\lambda_3 = \lambda_1 + \lambda_2$ (b) $\lambda_3 = \frac{\lambda_1\lambda_2}{\lambda_1 + \lambda_2}$
(c) $\lambda_1 + \lambda_2 + \lambda_3 = 0$ (d) $\lambda_3^2 = \lambda_1^2 + \lambda_2^2$. *(2005, 1990)*

58. Fission of nuclei is possible because the binding energy per nucleon in them
(a) increases with mass number at low mass numbers
(b) decreases with mass number at low mass numbers
(c) increases with mass number at high mass numbers
(d) decreases with mass number at high mass numbers. *(2005)*

59. A nucleus represented by the symbol ^A_ZX has
(a) Z neutrons and $A - Z$ protons
(b) Z protons and $A - Z$ neutrons
(c) Z protons and A neutrons
(d) A protons and $Z - A$ neutrons *(2004)*

60. If in a nuclear fusion process the masses of the fusing nuclei be m_1 and m_2 and the mass of the resultant nucleus be m_3, then
(a) $m_3 = m_1 + m_2$ (b) $m_3 = |m_1 - m_2|$
(c) $m_3 < (m_1 + m_2)$ (d) $m_3 > (m_1 + m_2)$ *(2004)*

61. The Bohr model of atoms
(a) Assumes that the angular momentum of electrons is quantized.
(b) Uses Einstein's photoelectric equation.
(c) Predicts continuous emission spectra for atoms.
(d) Predicts the same emission spectra for all types of atoms. *(2004)*

62. The half life of radium is about 1600 years. Of 100 g of radium existing now, 25 g will remain unchanged after
(a) 4800 years (b) 6400 years
(c) 2400 years (d) 3200 years *(2004)*

63. M_p denotes the mass of a proton and M_n that of a neutron. A given nucleus, of binding energy B, contains Z protons and N neutrons. The mass $M(N, Z)$ of the nucleus is given by (where c is the velocity of light)
(a) $M(N, Z) = NM_n + ZM_p - Bc^2$
(b) $M(N, Z) = NM_n + ZM_p + Bc^2$
(c) $M(N, Z) = NM_n + ZM_p - B/c^2$
(d) $M(N, Z) = NM_n + ZM_p + B/c^2$ *(2004)*

64. An electron is moving round the nucleus of a hydrogen atom in a circular orbit of radius r. The Coulomb force $\vec{F}$ between the two is
(a) $K\frac{e^2}{r^2}\hat{r}$ (b) $-K\frac{e^2}{r^3}\hat{r}$
(c) $K\frac{e^2}{r^3}\vec{r}$ (d) $-K\frac{e^2}{r^3}\vec{r}$
$\left(\text{where } K = \frac{1}{4\pi\varepsilon_0}\right)$ *(2003)*

65. Solar energy is mainly caused due to
(a) burning of hydrogen in the oxygen
(b) fission of uranium present in the Sun
(c) fusion of protons during synthesis of heavier elements
(d) gravitational contraction *(2003)*

66. The volume occupied by an atom is greater than the volume of the nucleus by a factor of about
(a) 10^1 (b) 10^5
(c) 10^{10} (d) 10^{15} *(2003)*

67. A sample of radioactive element has a mass of 10 g at an instant $t = 0$. The approximate mass of this element in the sample after two mean lives is
(a) 1.35 g (b) 2.50 g
(c) 3.70 g (d) 6.30 g *(2003)*

68. In which of the following systems will the radius of the first orbit ($n = 1$) be minimum?
(a) doubly ionized lithium
(b) singly ionized helium
(c) deuterium atom
(d) hydrogen atom *(2003)*

69. The mass of proton is 1.0073 u and that of neutron is 1.0087 u (u = atomic mass unit). The binding energy of ${}_{2}^{4}He$ is
(a) 0.0305 J (b) 0.0305 erg
(c) 28.4 MeV (d) 0.061 u
(Given helium nucleus mass = 4.0015 u.) *(2003)*

70. The mass number of a nucleus is
(a) always less than its atomic number
(b) always more than its atomic number
(c) sometimes equal to its atomic number
(d) sometimes less than and sometimes more than its atomic number *(2003)*

71. A nuclear reaction given by
$_{Z}X^{A} \rightarrow {}_{Z+1}Y^{A} + {}_{-1}e^{0} + \bar{\nu}$ represents
(a) β-decay (b) γ-decay
(c) fusion (d) fission *(2003)*

72. Which of the following are suitable for the fusion process?
(a) light nuclei (b) heavy nuclei
(c) element lying in the middle of the periodic table
(d) middle elements, which are lying on binding energy curve. *(2002)*

73. A sample of radioactive element containing 4×10^{16} active nuclei. Half life of element is 10 days, then number of decayed nuclei after 30 days
(a) 0.5×10^{16} (b) 2×10^{16}
(c) 3.5×10^{16} (d) 1×10^{16}. *(2002)*

74. A deutron is bombarded on ${}_{8}O^{16}$ nucleus then α-particle is emitted. The product nucleus is
(a) ${}_{7}N^{13}$ (b) ${}_{5}B^{10}$
(c) ${}_{4}Be^{9}$ (d) ${}_{7}N^{14}$. *(2002)*

75. Which rays contain (positive) charged particles?
(a) α-rays (b) β-rays
(c) γ-rays (d) X-rays. *(2001)*

76. $X(n, \alpha)\ {}_{3}^{7}Li$, then X will be
(a) ${}_{5}^{10}B$ (b) ${}_{5}^{9}B$
(c) ${}_{4}^{11}Be$ (d) ${}_{2}^{4}He$. *(2001)*

77. Half life of a radioactive element is 12.5 hour and its quantity is 256 g. After how much time its quantity will remain 1 g?
(a) 50 hrs (b) 100 hrs
(c) 150 hrs (d) 200 hrs. *(2001)*

78. The interplanar distance in a crystal is 2.8×10^{-8} m. The value of maximum wavelength which can be diffracted
(a) 2.8×10^{-8} m (b) 5.6×10^{-8} m
(c) 1.4×10^{-8} m (d) 7.6×10^{-8} m. *(2001)*

79. The energy of hydrogen atom in n^{th} orbit is E_n then the energy in n^{th} orbit of singly ionised helium atom will be
(a) $4E_n$ (b) $E_n/4$
(c) $2E_n$ (d) $E_n/2$. *(2001)*

80. M_n and M_p represent the mass of neutron and proton respectively. An element having mass M has N neutrons and Z protons, then the correct relation will be
(a) $M < \{N \cdot M_n + Z \cdot M_p\}$
(b) $M > \{N \cdot M_n + Z \cdot M_p\}$
(c) $M = \{N \cdot M_n + Z \cdot M_p\}$
(d) $M = N\,\{M_n + M_p\}$ *(2001)*

81. Energy released in nuclear fission is due to
(a) some mass is converted into energy
(b) total binding energy of fragments is more than the binding energy of parental element
(c) total binding energy of fragments is less than the binding energy of parental element
(d) total binding energy of fragments is equal to the binding energy of parental element. *(2001)*

82. For the given reaction, the particle X is
$${}_{6}C^{11} \rightarrow {}_{5}B^{11} + \beta^{+} + X$$
(a) neutron (b) anti neutrino
(c) neutrino (d) proton. *(2000)*

83. Maximum frequency of emission is obtained for the transition
(a) $n = 2$ to $n = 1$ (b) $n = 6$ to $n = 2$
(c) $n = 1$ to $n = 2$ (d) $n = 2$ to $n = 6$. *(2000)*

84. The relation between λ and $T_{1/2}$ as ($T_{1/2} \rightarrow$ half life)
(a) $T_{1/2} = \frac{\ln 2}{\lambda}$ (b) $T_{1/2}\ \ln 2 = \lambda$
(c) $T_{1/2} = \frac{1}{\lambda}$ (d) $(\lambda + T_{1/2}) = \ln 2$. *(2000)*

85. Nuclear fission is best explained by
(a) liquid droplet theory
(b) Yukawa π-meson theory
(c) independent particle model of the nucleus
(d) proton-proton cycle. *(2000)*

86. The life span of atomic hydrogen is
(a) fraction of one second
(b) one year
(c) one hour
(d) one day. *(2000)*

87. When an electron does transition from $n = 4$ to $n = 2$, then emitted line spectrum will be
(a) first line of Lyman series
(b) second line of Balmer series
(c) first line of Paschen series
(d) second line of Paschen series. *(2000)*

88. Alpha particles are
(a) neutrally charged
(b) positron
(c) protons
(d) ionized helium atoms *(1999)*

89. After 1α and 2β-emissions
(a) mass number reduces by 6
(b) mass number reduces by 4
(c) mass number reduces by 2
(d) atomic number remains unchanged *(1999)*

90. Complete the equation for the following fission process
$${}_{92}U^{235} + {}_{0}n^{1} \rightarrow {}_{38}Sr^{90} + ...$$
(a) ${}_{57}X^{142} + 3{}_{0}n^{1}$ (b) ${}_{54}X^{145} + 3{}_{0}n^{1}$
(c) ${}_{54}X^{143} + 3{}_{0}n^{1}$ (d) ${}_{54}X^{142} + {}_{0}n^{1}$ *(1998)*

91. A nucleus ${}_{n}X^{m}$ emits one α and two β particles. The resulting nucleus is
(a) ${}_{n-4}Z^{m-4}$ (b) ${}_{n-2}Y^{m-4}$
(c) ${}_{n}X^{m-4}$ (d) ${}_{n}Z^{m-4}$ *(1998)*

92. Atomic weight of Boron is 10.81 and it has two isotopes ${}_{5}B^{10}$ and ${}_{5}B^{11}$. Then the ratio of ${}_{5}B^{10} : {}_{5}B^{11}$ in nature would be
(a) 15 : 16 (b) 10 : 11
(c) 19 : 81 (d) 81 : 19 *(1998)*

93. In the Bohr model of a hydrogen atom, the centripetal force is furnished by the coulomb attraction between the proton and the electron. If a_0 is the radius of the ground state orbit, m is the mass and e is the charge on the electron and ε_0 is the vacuum permittivity, the speed of the electron is
(a) $\frac{e}{\sqrt{4\pi\varepsilon_0 a_0 m}}$ (b) $\frac{e}{\sqrt{\varepsilon_0 a_0 m}}$
(c) 0 (d) $\frac{\sqrt{4\pi\varepsilon_0 a_0 m}}{e}$ *(1998)*

94. The 21 cm radiowave emitted by hydrogen in interstellar space is due to the interaction called the hyperfine interaction in atomic hydrogen. The energy of the emitted wave is nearly
(a) 7×10^{-8} joule (b) 1 joule
(c) 10^{-17} joule (d) 10^{-24} joule *(1998)*

95. Half-lives of two radioactive substances A and B are respectively 20 minutes and 40 minutes. Initially the samples of A and B have equal number of nuclei. After 80 minutes the ratio of remaining numbers of A and B nuclei is
(a) 1 : 4 (b) 4 : 1
(c) 1 : 16 (d) 1 : 1 *(1998)*

96. Due to earth's magnetic field, the charged cosmic rays particles
(a) can never reach the pole
(b) can never reach the equator
(c) require greater kinetic energy to reach the equator than pole
(d) require less kinetic energy to reach the equator than pole. *(1997)*

97. Which of the following is used as a moderator in nuclear reaction?
(a) cadmium (b) plutonium
(c) uranium (d) heavy water. *(1997)*

98. The energy of the ground electronic state of hydrogen atom is − 13.6 eV. The energy of the first excited state will be
(a) − 27.2 eV (b) − 52.4 eV
(c) − 3.4 eV (d) − 6.8 eV. *(1997)*

99. When hydrogen atom is in its first excited level, its radius is .... of the Bohr radius.
(a) twice (b) 4 times
(c) same (d) half. *(1997)*

100. The most penetrating radiation out of the following are
(a) β-rays (b) γ-rays
(c) X-rays (d) α-rays. *(1997)*

101. The minimum wavelength of the X-rays produced by electrons accelerated through a potential difference of V volts is directly proportional to
(a) $\frac{1}{\sqrt{V}}$ (b) $\frac{1}{V}$
(c) $\sqrt{V}$ (d) V^2. *(1996)*

102. The energy of a hydrogen atom in its ground state is − 13.6 eV. The energy of the level corresponding to the quantum number n = 2 in the hydrogen atom is
(a) − 0.54 eV (b) − 3.4 eV
(c) − 2.72 eV (d) − 0.85 eV. *(1996)*

103. According to Bohr's principle, the relation between principal quantum number (n) and radius of orbit (r) is
(a) $r \propto \frac{1}{n}$ (b) $r \propto \frac{1}{n^2}$
(c) $r \propto n$ (d) $r \propto n^2$. *(1996)*

104. A nucleus ruptures into two nuclear parts, which have their velocity ratio equal to 2 : 1. What will be the ratio of their nuclear size (nuclear radius)?
(a) $3^{1/2} : 1$ (b) $1 : 3^{1/2}$
(c) $2^{1/3} : 1$ (d) $1 : 2^{1/3}$. *(1996)*

105. What is the respective number of α and β particles emitted in the following radioactive decay?
$$^{200}X_{90} \rightarrow {}^{168}Y_{80}$$
(a) 8 and 8 (b) 8 and 6
(c) 6 and 8 (d) 6 and 6. *(1995)*

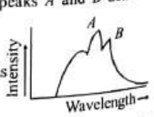
106. The binding energies per nucleon for a deuteron and an α-particle are x_1 and x_2 respectively. The energy Q released in the reaction
$$^2H_1 + {}^2H_1 \rightarrow {}^4He_2 + Q, \text{ is}$$
(a) $4(x_1 + x_2)$ (b) $4(x_2 - x_1)$
(c) $2(x_2 - x_1)$ (d) $2(x_1 + x_2)$. *(1995)*

107. The count rate of a Geiger Muller counter for the radiation of a radioactive material of half-life of 30 minutes decreases to 5 second^{-1} after 2 hours. The initial count rate was
(a) 80 second^{-1} (b) 625 second^{-1}
(c) 20 second^{-1} (d) 25 second^{-1}. *(1995)*

108. An electron makes a transition from orbit n = 4 to the orbit n = 2 of a hydrogen atom. What is the wavelength of the emitted radiations? (R = Rydberg's constant)
(a) $\frac{16}{4R}$ (b) $\frac{16}{5R}$
(c) $\frac{16}{2R}$ (d) $\frac{16}{3R}$. *(1995)*

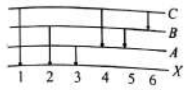
109. When a hydrogen atom is raised from the ground state to an excited state,
(a) both K.E. and P.E. increase
(b) both K.E. and P.E. decrease
(c) the P.E. decreases and K.E. increases
(d) the P.E. increases and K.E. decreases. *(1995)*

110. The figure represents the observed intensity of X-rays emitted by an X-ray tube, as a function of wave-length. The sharp peaks A and B denote



(a) white radiations
(b) characteristic radiations
(c) band spectrum
(d) continuous spectrum *(1995)*

111. The figure indicates the energy level diagram of an atom and the origin of six spectral lines in emission (*e.g.* line no. 5 arises from the transition from level B to A). Which of the following spectral lines will occur in the absorption spectrum?



(a) 4, 5, 6 (b) 1, 2, 3, 4, 5, 6
(c) 1, 2, 3 (d) 1, 4, 6. *(1995)*

112. The mass number of He is 4 and that of sulphur is 32. The radius of sulphur nucleus is larger than that of helium by the factor of
(a) 4 (b) 2
(c) 8 (d) $\sqrt{8}$. *(1995)*

113. The binding energy per nucleon is maximum in case of
(a) ^4_2He (b) $^{56}_{26}Fe$
(c) $^{141}_{56}Ba$ (d) $^{235}_{92}U$ *(1993)*

114. Which source is associated with a line emission spectrum?
(a) Electric fire (b) Neon street sign
(c) Red traffic light (d) Sun *(1993)*

115. Energy released in the fission of a single $^{235}_{92}U$ nucleus is 200 MeV. The fission rate of $^{235}_{92}U$ filled reactor operating at a power level of 5 W is
(a) $1.56 \times 10^{-10}\ s^{-1}$ (b) $1.56 \times 10^{11}\ s^{-1}$
(c) $1.56 \times 10^{-16}\ s^{-1}$ (d) $1.56 \times 10^{-17}\ s^{-1}$ *(1993)*

116. Hydrogen atoms are excited from ground state of the principle quantum number 4. Then the number of spectral lines observed will be
(a) 3 (b) 6
(c) 5 (d) 2 *(1993)*

117. In terms of Bohr radius a_0, the radius of the second Bohr orbit of a hydrogen atom is given by
(a) $4a_0$ (b) $8a_0$
(c) $\sqrt{2}a_0$ (d) $2a_0$ *(1992)*

118. Solar energy is due to
(a) fusion reaction
(b) fission reaction
(c) combustion reaction
(d) chemical reaction *(1992)*

119 The ionization energy of hydrogen atom is 13.6 eV. Following Bohr's theory, the energy corresponding to a transition between 3rd and 4th orbit is
(a) 3.40 eV (b) 1.51 eV
(c) 0.85 eV (d) 0.66 eV *(1992)*

120. The energy equivalent of one atomic mass unit is
(a) 1.6×10^{-19} J (b) 6.02×10^{23} J
(c) 931 MeV (d) 9.31 MeV *(1992)*

121. The mass of α-particle is
(a) less than the sum of masses of two protons and two neutrons
(b) equal to mass of four protons
(c) equal to mass of four neutrons
(d) equal to sum of masses of two protons and two neutrons *(1992)*

122. Of the following pairs of species which one will have the same electronic configuration for both members?
(a) Li^+ and Na^+ (b) He and Ne^+
(c) H and Li (d) C and N^+ *(1992)*

123. The mass density of a nucleus varies with mass number A as
(a) A^2 (b) A
(c) constant (d) $1/A$ *(1992)*

124. The constituents of atomic nuclei are believed to be
(a) neutrons and protons
(b) protons only
(c) electron and protons
(d) electrons, protons and neutrons *(1991)*

125. The half life of radium is 1600 years. The fraction of a sample of radium that would remain after 6400 years
(a) 1/4 (b) 1/2
(c) 1/8 (d) 1/16 *(1991)*

126. In the nucleus of $_{11}Na^{23}$, the number of protons, neutrons and electrons are
(a) 11, 12, 0 (b) 23, 12, 11
(c) 12, 11, 0 (d) 23, 11, 12 *(1991)*

127. The ground state energy of H-atom 13.6 eV. The energy needed to ionize H-atom from its second excited state
(a) 1.51 eV (b) 3.4 eV
(c) 13.6 eV (d) none of these *(1991)*

128. If the nuclear force between two protons, two neutrons and between proton and neutron is denoted by F_{pp}, F_{nn} and F_{pn} respectively, then
(a) $F_{pp} \approx F_{nn} \approx F_{pn}$
(b) $F_{pp} \neq F_{nn}$ and $F_{pp} = F_{nn}$
(c) $F_{pp} = F_{nn} = F_{pn}$
(d) $F_{pp} \neq F_{nn} \neq F_{pn}$ *(1991)*

129. The valence electron in alkali metal is a
(a) f-electron (b) p-electron
(c) s-electron (d) d-electron *(1990)*

130. Consider an electron in the n^{th} orbit of a hydrogen atom in the Bohr model. The circumference of the orbit can be expressed in terms of de Broglie wavelength λ of that electron as
(a) $(0.529)n\lambda$ (b) $\sqrt{n}\lambda$
(c) $(13.6)\lambda$ (d) $n\lambda$ *(1990)*

131. The nuclei $_6C^{13}$ and $_7N^{14}$ can be described as
(a) isotones (b) isobars
(c) isotopes of carbon
(d) isotopes of nitrogen *(1990)*

132. Which of the folowing statements is true for nuclear forces?
(a) They obey the inverse square law of distance.
(b) They obey the inverse third power law of distance.
(c) They are short range forces.
(d) they are equal in strength to electromagnetic forces. *(1990)*

133. The ratio of the radii of the nuclei $_{13}Al^{27}$ and $_{52}Te^{125}$ approximately
(a) 6 : 10 (b) 13 : 52
(c) 40 : 177 (d) 14 : 73 *(1990)*

134. The nucleus $_6C^{12}$ absorbs an energetic neutron and emits a beta particle (β). The resulting nucleus is
(a) $_7N^{14}$ (b) $_7N^{13}$
(c) $_5B^{13}$ (d) $_6C^{13}$ *(1990)*

135. A radioactive element has half life period 800 years. After 6400 years what amount will remain?
(a) 1/2 (b) 1/16
(c) 1/8 (d) 1/256 *(1989)*

136. An element A decays into element C by a two step process
$A \rightarrow B + {}_2He^4$; $B \rightarrow C + 2e^-$
Then
(a) A and C are isotopes
(b) A and C are isobars
(c) A and B are isotopes
(d) A and B are isobars *(1989)*

137. Curie is a unit of
(a) energy of gamma rays
(b) half-life (c) radioactivity
(d) intensity of gamma rays *(1989)*

138. The average binding energy of a nucleon inside an atomic nucleus is about
(a) 8 MeV (b) 8 eV
(c) 8 J (d) 8 erg *(1989)*

139. To explain his theory, Bohr used
(a) conservation of linear momentum
(b) quantisation of angular momentum
(c) conservation of quantum frequency
(d) none of these *(1989)*

140. The atomic number of silicon is 14. Its ground state electron configuration is
(a) $1s^2\, 2s^2\, 2p^2\, 2s^4$ (b) $1s^2\, 2s^2\, 2p^6\, 3s^1\, 3p^3$
(c) $1s^2\, 2s^2\, 2p^8\, 3s^2$ (d) $1s^2\, 2s^2\, 2p^6\, 3s^2\, 3p^2$ *(1989)*

141. A radioactive sample with a half life of 1 month has the label : 'Activity = 2 micro curies on 1 - 8 - 1991'. What would be its activity two months earlier?
(a) 1.0 micro curie (b) 0.5 micro curie
(c) 4 micro curie (d) 8 micro curie *(1988)*

142. The nucleus $^{115}_{48}Cd$, after two successive β-decay will give
(a) $^{115}_{46}Pa$ (b) $^{114}_{49}In$
(c) $^{113}_{50}Sn$ (d) $^{115}_{50}Sn$ *(1988)*

143. The ionisation energy of hydrogen atom is 13.6 eV, the ionisation energy of a singly ionised helium atom would be
(a) 13.6 eV (b) 27.2 eV
(c) 6.8 eV (d) 54.4 eV *(1988)*

EXPLANATIONS

1. **(c)** : If $\vec{p}_{Th}$ and $\vec{p}_{He}$ are the momenta of thorium and helium nuclei respectively, then according to law of conservation of linear momentum

$0 = \vec{p}_{Th} + \vec{p}_{He}$ or $\vec{p}_{Th} = -\vec{p}_{He}$

–ve sign shows that both are moving in opposite directions.

But in magnitude

$p_{Th} = p_{He}$

If m_{Th} and m_{He} are the masses of thorium and helium nuclei respectively, then

Kinetic energy of thorium nucleus is $K_{Th} = \frac{p_{Th}^2}{2m_{Th}}$

and that of helium nucleus is

$$K_{He} = \frac{p_{He}^2}{2m_{He}}$$

$$\therefore \quad \frac{K_{Th}}{K_{He}} = \left(\frac{p_{Th}}{p_{He}}\right)^2\left(\frac{m_{He}}{m_{Th}}\right)$$

But $p_{Th} = p_{He}$ and $m_{He} < m_{Th}$

$\therefore K_{Th} < K_{He}$ or $K_{He} > K_{Th}$

Thus the helium nucleus has more kinetic energy than the thorium nucleus.

2. **(b)** : The wavelength of a spectral line in the Lyman series is

$$\frac{1}{\lambda_L} = R\left(\frac{1}{1^2} - \frac{1}{n^2}\right),\ n = 2,3,4, \ldots\ldots$$

and that in the Balmer series is

$$\frac{1}{\lambda_B} = R\left(\frac{1}{2^2} - \frac{1}{n^2}\right),\ n = 3,4,5, \ldots\ldots$$

For the longest wavelength in the Lyman series, $n = 2$

$$\therefore \quad \frac{1}{\lambda_L} = R\left(\frac{1}{1^2} - \frac{1}{2^2}\right) = R\left(\frac{1}{1} - \frac{1}{4}\right) = R\left(\frac{4-1}{4}\right) = \frac{3R}{4}$$

or $\lambda_L = \frac{4}{3R}$

For the longest wavelength in the Balmer series, $n = 3$

$$\therefore \quad \frac{1}{\lambda_B} = R\left(\frac{1}{2^2} - \frac{1}{3^2}\right) = R\left(\frac{1}{4} - \frac{1}{9}\right) = R\left(\frac{9-4}{36}\right) = \frac{5R}{36}$$

or $\lambda_B = \frac{36}{5R}$

Thus, $\frac{\lambda_L}{\lambda_B} = \frac{\frac{4}{3R}}{\frac{36}{5R}} = \frac{4}{3R} \times \frac{5R}{36} = \frac{5}{27}$

3. **(d)** : Radius of the nucleus $R = R_0 A^{1/3}$

$$\therefore \quad \frac{R_{Al}}{R_{Te}} = \left(\frac{A_{Al}}{A_{Te}}\right)^{1/3}$$

Here, $A_{Al} = 27$, $A_{Te} = 125$, $R_{Te} = ?$

$$\frac{R_{Al}}{R_{Te}} = \left(\frac{27}{125}\right)^{1/3} = \frac{3}{5} \Rightarrow R_{Te} = \frac{5}{3} R_{Al}$$

4. **(d)** : Energy of electron in He^+ 3[rd] orbit

$$E_3 = -13.6 \times \frac{Z^2}{n^2}\ \text{eV} = -13.6 \times \frac{4}{9}\ \text{eV}$$

$$= -13.6 \times \frac{4}{9} \times 1.6 \times 10^{-19}\ \text{J} \simeq 9.7 \times 10^{-19}\ \text{J}$$

As per Bohr's model,

Kinetic energy of electron in the 3[rd] orbit $= -E_3$

$$\therefore \quad 9.7 \times 10^{-19} = \frac{1}{2} m_e v^2$$

$$v = \sqrt{\frac{2 \times 9.7 \times 10^{-19}}{9.1 \times 10^{-31}}} = 1.46 \times 10^6\ \text{m s}^{-1}$$

5. **(c)** : Energy of the photon, $E = \frac{hc}{\lambda}$

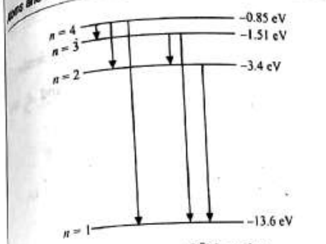
$$E = \frac{6.63 \times 10^{-34} \times 3 \times 10^8}{975 \times 10^{-10}}\ \text{J}$$

$$= \frac{6.63 \times 10^{-34} \times 3 \times 10^8}{975 \times 10^{-10} \times 1.6 \times 10^{-19}}\ \text{eV} = 12.75\ \text{eV}$$

After absorbing a photon of energy 12.75 eV, the electron will reach to third excited state of energy –0.85 eV, since energy difference corresponding to $n = 1$ and $n = 4$ is 12.75 eV.

$\therefore$ Number of spectral lines emitted

$$= \frac{(n)(n-1)}{2} = \frac{(4)(4-1)}{2} = 6$$



6. **(d)** : Binding energy of ^7_3Li nucleus
$= 7 \times 5.60$ MeV $= 39.2$ MeV

Binding energy of ^4_2He nucleus
$= 4 \times 7.06$ MeV $= 28.24$ MeV

The reaction is

$^7_3Li + ^1_1H \rightarrow 2(^4_2He) + Q$

$\therefore$ $Q = 2(\text{BE of } ^4_2He) - (\text{BE of } ^7_3Li)$
$= 2 \times 28.24$ MeV $- 39.2$ MeV
$= 56.48$ MeV $- 39.2$ MeV
$= 17.28$ MeV

7. **(c)** :

	X	$\rightarrow$	Y
Number of nuclei at $t = 0$	N_0		0
Number of nuclei after time t	$N_0 - x$		x

(As per question)

$$\frac{N_0 - x}{x} = \frac{1}{7}$$

$7N_0 - 7x = x$ or $x = \frac{7}{8} N_0$

$\therefore$ Remaining nuclei of isotope X

$$= N_0 - x = N_0 - \frac{7}{8} N_0 = \frac{1}{8} N_0 = \left(\frac{1}{2}\right)^3 N_0$$

So three half lives would have been passed.

$\therefore$ $t = nT_{1/2} = 3 \times 1.4 \times 10^9$ years
$= 4.2 \times 10^9$ years

Hence, the age of the rock is 4.2×10^9 years.

8. **(c)** : The wavelength of different spectral lines of Lyman series is given by

$$\frac{1}{\lambda_L} = R\left[\frac{1}{1^2} - \frac{1}{n^2}\right] \text{ where } n = 2, 3, 4, \ldots$$

where subscript L refers to Lyman.

For longest wavelength, $n = 2$

$$\therefore \frac{1}{\lambda_{L_{longest}}} = R\left[\frac{1}{1^2} - \frac{1}{2^2}\right] = \frac{3}{4} R \quad \ldots(i)$$

The wavelength of different spectral series of Balmer series is given by

$$\frac{1}{\lambda_B} = R\left[\frac{1}{2^2} - \frac{1}{n^2}\right] \text{ where } n = 3, 4, 5, \ldots$$

where subscript B refers to Balmer.

For longest wavelength, $n = 3$

$$\therefore \frac{1}{\lambda_{B_{longest}}} = R\left[\frac{1}{2^2} - \frac{1}{3^2}\right] = R\left[\frac{1}{4} - \frac{1}{9}\right] = \frac{5R}{36} \quad \ldots(ii)$$

Divide (ii) by (i), we get

$$\frac{\lambda_{L_{longest}}}{\lambda_{B_{longest}}} = \frac{5R}{36} \times \frac{4}{3R} = \frac{5}{27}$$

9. **(a)** : As $^2_1H + ^2_1H \rightarrow ^4_2He$

Here, $\Delta M = 0.02866$ u

$\therefore$ The energy liberated per u is

$$= \frac{\Delta M \times 931}{4}\ \text{MeV}$$

$$= \frac{0.02866 \times 931}{4}\ \text{MeV} = \frac{26.7}{4}\ \text{MeV} = 6.675\ \text{MeV}$$

10. **(d)** :

	X	$\rightarrow$	Y
Initial number of atoms,	N_0		0
Number of atoms after time t	N		$N_0 - N$

As per question

$$\frac{N}{N_0 - N} = \frac{1}{7}$$

$7N = N_0 - N$

$8N = N_0$

$$\frac{N}{N_0} = \frac{1}{8}$$

As $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n$ where n is the no. of half lives

$$\therefore \frac{1}{8} = \left(\frac{1}{2}\right)^n$$

$$\left(\frac{1}{2}\right)^3 = \left(\frac{1}{2}\right)^n$$

$\therefore n = 3$

$n = \frac{t}{T_{1/2}}$ or $t = nT_{1/2} = 3 \times 20$ years $= 60$ years

Hence, the age of rock is 60 years.

11. (c)

12. (d) : The time period T of an electron in a Bohr orbit of principal quantum number n is

$$T = \frac{4\varepsilon_0^2 h^3 n^3}{me^4}$$

$$T \propto n^3$$

$$\therefore \quad \frac{T_1}{T_2} = \frac{n_1^3}{n_2^3}$$

As $T_1 = 8T_2$, the above relation gives

$$\left(\frac{n_1}{n_2}\right)^3 = 8 \quad \text{or} \quad n_1 = 2n_2$$

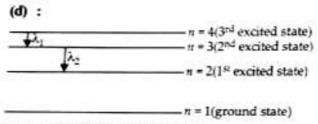
Thus the possible values of n_1 and n_2 are

$n_1 = 2, n_2 = 1;$

$n_1 = 4, n_2 = 2; n_1 = 6, n_2 = 3$, and so on.

13. (b) : For a given energy, γ-rays has highest penetrating power and α-particles has least penetrating power.

14. (d) :



According to Rydberg formula

$$\frac{1}{\lambda} = R\left[\frac{1}{n_f^2} - \frac{1}{n_i^2}\right]$$

In first case, $n_f = 3, n_i = 4$

$$\therefore \quad \frac{1}{\lambda_1} = R\left[\frac{1}{3^2} - \frac{1}{4^2}\right] = R\left[\frac{1}{9} - \frac{1}{16}\right] = \frac{7}{144}R \quad \text{...(i)}$$

In second case, $n_f = 2, n_i = 3$

$$\therefore \quad \frac{1}{\lambda_2} = R\left[\frac{1}{2^2} - \frac{1}{3^2}\right] = R\left[\frac{1}{4} - \frac{1}{9}\right] = \frac{5}{36}R \quad \text{...(ii)}$$

Divide (ii) by (i), we get

$$\frac{\lambda_1}{\lambda_2} = \frac{5}{36} \times \frac{144}{7} = \frac{20}{7}$$

15. (c) : Nuclear radius, $R = R_0 A^{1/3}$

where R_0 is a constant and A is the mass number

$$\therefore \quad \frac{R_{Al}}{R_{Cu}} = \frac{(27)^{1/3}}{(64)^{1/3}} = \frac{3}{4}$$

or $R_{Cu} = \frac{4}{3} \times R_{Al} = \frac{4}{3} \times 3.6$ fermi $= 4.8$ fermi

16. (d) : Let after t s amount of the A_1 and A_2 will become equal in the mixture.

As $N = N_0\left(\frac{1}{2}\right)^n$

where n is the number of half-lives

For A_1, $N_1 = N_{01}\left(\frac{1}{2}\right)^{t/20}$

For A_2, $N_2 = N_{02}\left(\frac{1}{2}\right)^{t/10}$

According to question, $N_1 = N_2$

$$\frac{40}{2^{t/20}} = \frac{160}{2^{t/10}}$$

$2^{t/10} = 4(2^{t/20})$ or $2^{t/10} = 2^2 2^{t/20}$

$$2^{t/10} = 2^{\left(\frac{t}{20}+2\right)}$$

$$\frac{t}{10} = \frac{t}{20} + 2 \quad \text{or} \quad \frac{t}{10} - \frac{t}{20} = 2$$

or $\frac{t}{20} = 2$ or $t = 40$ s

17. (a) : According to Rydberg formula

$$\frac{1}{\lambda} = R\left[\frac{1}{n_f^2} - \frac{1}{n_i^2}\right]$$

Here, $n_f = 1, n_i = 5$

$$\therefore \quad \frac{1}{\lambda} = R\left[\frac{1}{1^2} - \frac{1}{5^2}\right] = R\left[\frac{1}{1} - \frac{1}{25}\right] = \frac{24}{25}R$$

According to conservation of linear momentum, we get

Momentum of photon = Momentum of atom

$$\frac{h}{\lambda} = mv \quad \text{or} \quad v = \frac{h}{m\lambda} = \frac{h}{m}\left(\frac{24R}{25}\right) = \frac{24hR}{25m}$$

18. (d)

19. (b) : According to radioactive decay law

$N = N_0 e^{-\lambda t}$

where N_0 = Number of radioactive nuclei at time $t = 0$

N = Number of radioactive nuclei left undecayed at any time t

λ = decay constant

At time t_2, $\frac{2}{3}$ of the sample had decayed

$$\therefore \quad N = \frac{1}{3}N_0$$

$$\therefore \quad \frac{1}{3}N_0 = N_0 e^{-\lambda t_2} \quad \text{...(i)}$$

At time t_1, $\frac{1}{3}$ of the sample had decayed,

$$\therefore \quad N = \frac{2}{3}N_0$$

$$\therefore \quad \frac{2}{3}N_0 = N_0 e^{-\lambda t_1} \quad \text{...(ii)}$$

Divide (i) by (ii), we get

$$\frac{1}{2} = \frac{e^{-\lambda t_2}}{e^{-\lambda t_1}}$$

$$\frac{1}{2} = e^{-\lambda(t_2 - t_1)}$$

$$\lambda(t_2 - t_1) = \ln 2$$

$$t_2 - t_1 = \frac{\ln 2}{\lambda} = \frac{\ln 2}{\left(\frac{\ln 2}{T_{1/2}}\right)} \quad \left(\because \lambda = \frac{\ln 2}{T_{1/2}}\right)$$

$$= T_{1/2} = 50 \text{ days}$$

20. (d) : The wavelength of the first line of lyman series for hydrogen atom is

$$\frac{1}{\lambda} = R\left[\frac{1}{1^2} - \frac{1}{2^2}\right]$$

The wavelength of the second line of Balmer series for hydrogen like ion is

$$\frac{1}{\lambda'} = Z^2 R\left[\frac{1}{2^2} - \frac{1}{4^2}\right]$$

According to question $\lambda = \lambda'$

$$\Rightarrow \quad R\left[\frac{1}{1^2} - \frac{1}{2^2}\right] = Z^2 R\left[\frac{1}{2^2} - \frac{1}{4^2}\right]$$

or $\frac{3}{4} = \frac{3Z^2}{16}$ or $Z^2 = 4$ or $Z = 2$

21. (b) : $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n$

where n is number of half lives

$$\therefore \frac{1}{16} = \left(\frac{1}{2}\right)^n \text{ or } \left(\frac{1}{2}\right)^4 = \left(\frac{1}{2}\right)^n \text{ or } n = 4$$

Let the age of rock be t years.

$$\because \quad n = \frac{t}{T_{1/2}}$$

or $t = nT_{1/2} = 4 \times 50$ years $= 200$ years

22. (c) : According to Einstein's mass energy relation

$$E = mc^2 \quad \text{or} \quad m = \frac{E}{c^2}$$

Mass decay per second

$$= \frac{\Delta m}{\Delta t} = \frac{1}{c^2}\frac{\Delta E}{\Delta t} = \frac{P}{c^2} = \frac{1000 \times 10^3 \text{ W}}{(3 \times 10^8 \text{ m/s})^2}$$

$$= \frac{10^6}{9 \times 10^{16}} \text{ kg/s}$$

Mass decay per hour

$$= \frac{\Delta m}{\Delta t} \times 60 \times 60 = \left(\frac{10^6}{9 \times 10^{16}} \text{ kg/s}\right)(3600 \text{ s})$$

$$= 4 \times 10^{-8} \text{ kg} = 40 \times 10^{-6} \text{ g} = 40\ \mu\text{g}$$

23. (b) : Momentum of emitted photon

$$= p_{photon} = \frac{h\upsilon}{c}$$

From the law of conservation of linear momentum, Momentum of recoil nucleus

$$= p_{nucleus} = p_{photon}$$

$$\therefore Mv = \frac{h\upsilon}{c}$$

where v is the recoil speed of the nucleus

$$\text{or} \quad v = \frac{h\upsilon}{Mc} \quad \text{...(i)}$$

The recoil energy of the nucleus

$$= \frac{1}{2}Mv^2 = \frac{1}{2}M\left(\frac{h\upsilon}{Mc}\right)^2 = \frac{h^2\upsilon^2}{2Mc^2} \quad \text{(Using (i))}$$

24. (c) : When an alpha particle $\left({}_2^4He\right)$ is emitted, the mass number and the atomic number of the daughter nucleus decreases by four and two respectively. When a beta particle (β) is emitted, the atomic number of the daughter nucleus

increases by one but the mass number remains the same.

$$\therefore\ {}^{m}_{n}X \xrightarrow{\alpha} {}^{m-4}_{n-2}Y \xrightarrow{2\beta^-} {}^{m-4}_{n}X$$

25. **(c)** : Extremely high temperature needed for fusion make kinetic energy large enough to overcome coulomb repulsion between nuclei.

26. **(c)** : Here, Stopping potential, $V_0 = 10\text{V}$

Work function, $W = 2.75$ eV

According to Einstein's photoelectric equation

$eV_0 = h\upsilon - W$

or $h\upsilon = eV_0 + W$

$= 10\text{ eV} + 2.75\text{ eV} = 12.75\text{ eV}$ ...(i)

When an electron in the hydrogen atom makes a transition from excited state n to the gound state (n=1), then the frequency (υ) of the emitted photon is given by

$h\upsilon = E_n - E_1$

$$h\upsilon = -\frac{13.6}{n^2} - \left(-\frac{13.6}{1^2}\right)$$

$$\left[\because \text{ For hydrogen atom}, E_n = -\frac{13.6}{n^2}\text{eV}\right]$$

According to given problem

$$-\frac{13.6}{n^2} + 13.6 = 12.75 \qquad \text{(Using (i))}$$

$$\frac{13.6}{n^2} = 0.85 \Rightarrow n^2 = \frac{13.6}{0.85} = 16$$

or $n = 4$

27. **(c)** :

	P	Q
No. of nuclei, at $t = 0$	$4N_0$	N_0
Half- life	1 min	2 min
No. of nuclei after time t	N_P	N_Q

Let after t min the number of nuclei of P and Q are equal.

$$\therefore\ N_P = 4N_0\left(\frac{1}{2}\right)^{t/1} \text{ and } N_Q = N_0\left(\frac{1}{2}\right)^{t/2}$$

As $N_P = N_Q$

$$\therefore 4N_0\left(\frac{1}{2}\right)^{t/1} = N_0\left(\frac{1}{2}\right)^{t/2}$$

$$\frac{4}{2^{t/1}} = \frac{1}{2^{t/2}} \text{ or } 4 = \frac{2^t}{2^{t/2}}$$

or $4 = 2^{t/2}$ or $2^2 = 2^{t/2}$

or $\frac{t}{2} = 2$ or $t = 4$ min

After 4 minutes, both P and Q have equal number of nuclei.

$\therefore$ Number of nuclei of R

$$= \left(4N_0 - \frac{N_0}{4}\right) + \left(N_0 - \frac{N_0}{4}\right)$$

$$= \frac{15N_0}{4} + \frac{3N_0}{4} = \frac{9N_0}{2}$$

28. **(c)** : The energy of n^{th} orbit of hydrogen atom is given as

$$E_n = -\frac{13.6}{n^2}\text{ eV}$$

$\therefore\ E_1 = -13.6$ eV

$$E_2 = -\frac{13.6}{2^2} = -3.4\text{ eV}$$

$$E_3 = -\frac{13.6}{3^2} = -1.5\text{ eV}$$

$$E_4 = -\frac{13.6}{4^2} = -0.85\text{ eV}$$

$\therefore\ E_3 - E_2 = -1.5 - (-3.4) = 1.9$ eV

$E_4 - E_3 = -0.85 - (-1.5) = 0.65$ eV

29. **(b)** : For ${}^{7}_{3}\text{Li}$ nucleus,

Mass defect, $\Delta M = 0.042$ u

$\because\ 1\text{ u} = 931.5\text{ MeV}/c^2$

$\therefore \Delta M = 0.042 \times 931.5\text{ MeV}/c^2$

$= 39.1\text{ MeV}/c^2$

Binding energy, $E_b = \Delta Mc^2$

$$= \left(39.1\frac{\text{MeV}}{c^2}\right)c^2$$

$= 39.1$ MeV

Binding energy per nucleon, $E_{bn} = \frac{E_b}{A} = \frac{39.1\text{ MeV}}{7}$

$= 5.6$ MeV

30. **(d)** : According to activity law

$R = R_0e^{-\lambda t}$ ...(i)

where,

R_0 = initial activity at $t = 0$

R = activity at time t

λ = decay constant

According to given problem,

$R_0 = N_0$ counts per minute

$R = \frac{N_0}{e}$ counts per minute

$t = 5$ minutes

Substituting these values in equation (i), we get

$$\frac{N_0}{e} = N_0e^{-5\lambda}$$

$e^{-1} = e^{-5\lambda}$

$5\lambda = 1$ or $\lambda = \frac{1}{5}$ per minute

At $t = T_{1/2}$, the activity R reduces to $\frac{R_0}{2}$.

where $T_{1/2}$ = half life of a radioactive sample

From equation (i), we get

$$\frac{R_0}{2} = R_0e^{-\lambda T_{1/2}}$$

$e^{\lambda T1/2} = 2$

Taking natural logarithms of both sides of above equation, we get

$\lambda T_{1/2} = \log_e 2$

$$\text{or } T_{1/2} = \frac{\log_e 2}{\lambda} = \frac{\log_e 2}{\left(\frac{1}{5}\right)}$$

$= 5\log_e 2$ minutes

31. **(a)** : Energy of an hydrogen like atom like He$^+$ in an n^{th} orbit is given by

$$E_n = -\frac{13.6Z^2}{n^2}\text{ eV}$$

For hydrogen atom, $Z = 1$

$$\therefore E_n = -\frac{13.6}{n^2}\text{eV}$$

For ground state, $n = 1$

$$\therefore\ E_1 = -\frac{13.6}{1^2}\text{ eV} = -13.6\text{ eV}$$

For He$^+$ ion, $Z = 2$

$$E_n = -\frac{4(13.6)}{n^2}\text{eV}$$

For first excited state, $n = 2$

$$\therefore\ E_2 = -\frac{4(13.6)}{(2)^2}\text{eV} = -13.6\text{ eV}$$

Hence, the energy in He$^+$ ion in first excited state is same that of energy of the hydrogen atom in ground state *i.e.* – 13.6 eV.

32. **(c)** : At the distance of closest approach d,

Kinetic energy = Potential energy

$$\frac{1}{2}mv^2 = \frac{1}{4\pi\varepsilon_0}\frac{(2e)(Ze)}{d}$$

where,

Ze = charge of target nucleus

$2e$ = charge of alpha nucleus

$\frac{1}{2}mv^2$ = kinetic energy of alpha nucleus of mass m moving with velocity v

$$\text{or } d = \frac{2Ze^2}{4\pi\varepsilon_0\left(\frac{1}{2}mv^2\right)} \therefore\ d \propto \frac{1}{m}$$

33. **(c)** : $A_1 = \lambda N_1$ at time t_1

$A_2 = \lambda N_2$ at time t_2

Therefore, number of nuclei decayed during time interval $(t_1 - t_2)$ is

$$N_1 - N_2 = \frac{[A_1 - A_2]}{\lambda}$$

34. **(a)** : ${}_1H^2 + {}_1H^2 \rightarrow {}_2He^4 + \Delta E$

The binding energy per nucleon of a deuteron $= 1.1$ MeV

$\therefore$ Total binding energy $= 2 \times 1.1 = 2.2$ MeV

The binding energy per nucleon of a helium nuclei $= 7$ MeV

$\therefore$ Total binding energy $= 4 \times 7 = 28$ MeV

Hence, energy released

$\Delta E = (28 - 2 \times 2.2) = 23.6$ MeV

35. **(d)** : ${}_{Z}^{A}X \xrightarrow{\beta^-} {}_{Z+1}^{A}Y \xrightarrow{\alpha} {}_{Z-1}^{A-4}B^* \xrightarrow{\gamma} {}_{Z-1}^{A-4}B$

First X decays by β^- emission emitting $\bar{\upsilon}$, antineutrino simultaneously. Y emits α resulting in the excited level of B which in turn emits a γ ray.

$\therefore \beta^-, \alpha, \gamma$ is the answer.

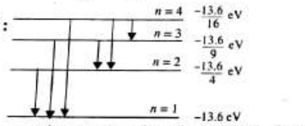
36. **(c)** : ${}_{Z}^{A}X \xrightarrow{2\beta^-} {}_{Z+2}^{A}Y_1 \xrightarrow{\alpha} {}_{Z}^{A-4}Y_2$

The resultant daughter is an isotope of the original parent nucleus.

37. **(a)** : Energy of the projectile is the potential energy at closest approach, $\frac{1}{4\pi\varepsilon_0}\frac{z_1 z_2}{r}$

Therefore energy $\propto z_1 z_2$.

38. **(c)** :



The maximum wavelength emitted here corresponds to the transition $n = 4 \rightarrow n = 3$ (Paschen series 1st line)

39. **(c)** : $ZM_p + (A-Z)M_n - M(A, Z)$

$=$ mass effect $= \frac{B.E}{c^2}$

$\Rightarrow M(A,Z) = ZM_p + (A-Z)M_n - \frac{B.E}{c^2}$

40. **(b)** : $A_1 : A_2 = 1 : 3$

Their radii will be in the ratio

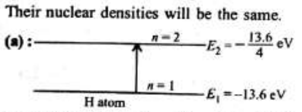
$R_0 A_1^{1/3} : R_0 A_2^{1/3} = 1 : 3^{1/3}$

Density $= \frac{A}{\frac{4}{3}\pi R^3}$

$\therefore \quad \rho_{A_1} : \rho_{A_2} = \frac{1}{\frac{4}{3}\pi R_0^3 \cdot 1^3} = \frac{3}{\frac{4}{3}\pi R_0^3 (3^{1/3})^3}$

Their nuclear densities will be the same.

41. **(a)** :



1st excitation energy $E_{n2} - E_{n1} = (-3.4 + 13.6)$

$= 10.2$ eV

42. **(a)** : $X_1 = N_0 e^{-\lambda_1 t}$; $X_2 = N_0 e^{-\lambda_2 t}$

$\frac{X_1}{X_2} = e^{-1} = e^{(-\lambda_1 + \lambda_2)t}$; $e^{-1} = e^{-(\lambda_1 - \lambda_2)t}$

$\therefore \quad t = \left|\frac{1}{\lambda_1 - \lambda_2}\right| = \frac{1}{(5\lambda - \lambda)} = \frac{1}{4\lambda}$

43. **(c)** : Given : $\lambda_A = 5\lambda$, $\lambda_B = \lambda$

At $t = 0$, $(N_0)_A = (N_0)_B$

$\frac{N_A}{N_B} = \left(\frac{1}{e}\right)^2$

According to radioactive decay, $\frac{N}{N_0} = e^{-\lambda t}$

$\therefore \quad \frac{N_A}{(N_0)_A} = e^{-\lambda_A t}$ ... (i)

$\frac{N_B}{(N_0)_B} = e^{-\lambda_B t}$ ... (ii)

Divide (i) by (ii), we get

$\frac{N_A}{N_B} = e^{-(\lambda_A - \lambda_B)t}$ or, $\frac{N_A}{N_B} = e^{-(5\lambda - \lambda)t}$

or, $\left(\frac{1}{e}\right)^2 = e^{-4\lambda t}$ or, $\left(\frac{1}{e}\right)^2 = \left(\frac{1}{e}\right)^{4\lambda t}$

or, $4\lambda t = 2 \quad \Rightarrow \quad t = \frac{2}{4\lambda} = \frac{1}{2\lambda}$.

44. **(a)** : In beta minus decay (β^-), a neutron is transformed into a proton and an electron is emitted with the nucleus along with an antineutrino.

$$n \rightarrow p + e^- + \bar{\nu}$$

where $\bar{\nu}$ is the antineutrino.

45. **(a)** : In mass spectrometer when ions are accelerated through potential V,

$\frac{1}{2}mv^2 = qV$ ... (i)

where m is the mass of ion, q is the charge of the ion.

As the magnetic field curves the path of the ions in a semicircular orbit

$\therefore \quad Bqv = \frac{mv^2}{R} \Rightarrow v = \frac{BqR}{m}$ ... (ii)

Substituting (ii) in (i), we get

$\frac{1}{2}m\left[\frac{BqR}{m}\right]^2 = qV$ or, $\frac{q}{m} = \frac{2V}{B^2R^2}$

Since V, B are constants,

$\frac{q}{m} \propto \frac{1}{R^2}$ or, $\frac{\text{charge on the ion}}{\text{mass of the ion}} \propto \frac{1}{R^2}$.

46. **(a)**

47. **(d)** : Nuclear radii $R = (R_0)A^{1/3}$

where A is the mass number.

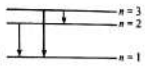
$\therefore \frac{R_{Te}}{R_{Al}} = \left(\frac{A_{Te}}{A_{Al}}\right)^{1/3} = \left(\frac{125}{27}\right)^{1/3} = \left(\frac{5}{3}\right)$

or, $R_{Te} = \frac{5}{3} \times R_{Al} = \frac{5}{3} \times 3.6 = 6$ fm.

(Given $R_{Al} = 3.6$ fm)

48. **(d)** : Energy of n^{th} orbit of hydrogen atom is given by

$E_n = \frac{-13.6}{n^2}$ eV



For ground state, $n = 1$

$\therefore E_1 = \frac{-13.6}{1^2} = -13.6$ eV

For first excited state, $n = 2$

$\therefore E_2 = \frac{-13.6}{2^2} = -3.4$ eV

Kinetic energy of an electron in the first excited state is

$K = -E_2 = 3.4$ eV.

49. **(c)** : Ionisation potential of hydrogen atom is 13.6 eV.

Energy required for exciting the hydrogen atom in the ground state to orbit n is given by

$E = E_n - E_1$

i.e. $12.1 = -\frac{13.6}{n^2} - \left(\frac{-13.6}{1^2}\right) = -\frac{13.6}{n^2} + 13.6$

or, $-1.5 = \frac{-13.6}{n^2}$ or, $n^2 = \frac{13.6}{1.5} = 9$ or, $n = 3$

Number of spectral lines emitted

$= \frac{n(n-1)}{2} = \frac{3 \times 2}{2} = 3$.

50. **(b)** : According to activity law, $R = R_0 e^{-\lambda t}$

$\therefore R_1 = R_0 e^{-\lambda t_1}$ and $R_2 = R_0 e^{-\lambda t_2}$

$\therefore \frac{R_1}{R_2} = \frac{R_0 e^{-\lambda t_1}}{R_0 e^{-\lambda t_2}} = e^{-\lambda t_1} e^{\lambda t_2} = e^{-\lambda(t_1 - t_2)}$

or, $R_1 = R_2 e^{-\lambda(t_1 - t_2)}$.

51. **(c)** : ${}_{1}^{2}H + {}_{1}^{2}H \rightarrow {}_{2}^{4}He$ + energy

$\therefore$ Energy released = B.E. of ${}_{2}^{4}He$ − 2(B.E. of ${}_{1}^{2}H$)

$= 28 - 2(2.2) = 28 - 4.4 = 23.6$ MeV.

52. **(a)** : Nuclear radii $R = R_0(A)^{1/3}$, where $R_0 = 1.2$ Fm

or $R \propto (A)^{1/3}$

$\therefore \frac{R_{Be}}{R_{Ge}} = \frac{(9)^{1/3}}{(A)^{1/3}}$ or, $\frac{R_{Be}}{2R_{Be}} = \frac{(9)^{1/3}}{(A)^{1/3}}$

($\because$ given $R_{Ge} = 2R_{Be}$)

or, $(A)^{1/3} = 2 \times (9)^{1/3}$ or, $A = 2^3 \times 9 = 8 \times 9 = 72$.

$\therefore$ The number of nucleons in Ge is 72.

53. **(c)** : Energy released, $E = (\Delta m) \times 931$ MeV

Δm = mass of product − mass of reactant

$\Delta m = c - a - b$

$E = (\Delta m) \times 931$ or, $E = (c - a - b)$.

54. **(a)** : K.E. $= \left|\frac{1}{2}\text{P.E.}\right|$

But P.E. is negative.

$\therefore$ Total energy =

$\left|\frac{1}{2}\text{P.E.}\right| - \text{P.E.} = \frac{-P.E.}{2} = -3.4$ eV.

$\therefore$ K.E. $= +3.4$ eV.

55. **(a)** : Isotones means number of neutron remains same.

56. **(c)**

57. **(b)** :

$(E_C - E_A) = (E_C - E_B) + (E_B - E_A)$

$\frac{hc}{\lambda_3} = \frac{hc}{\lambda_1} + \frac{hc}{\lambda_2}$ or $\frac{1}{\lambda_3} = \frac{1}{\lambda_1} + \frac{1}{\lambda_2}$

$\therefore \frac{1}{\lambda_3} = \frac{\lambda_1 + \lambda_2}{\lambda_1 \lambda_2}$ or $\lambda_3 = \frac{\lambda_1 \lambda_2}{\lambda_1 + \lambda_2}$

58. **(d)** : For nuclei having $A > 56$ binding energy per nucleon gradually decreases.

59. **(b)** : Z is number of protons and A is the total number of protons and neutrons.

60. **(c)** : In nuclear fusion the mass of end product or resultant is always less than the sum of initial product, the rest is liberated in the form of energy, like in Sun energy is liberated due to fusion of two hydrogen atoms.

61. **(a)** : Bohr made a hypothesis-he proposed that there are certain special state of motion called stationary states, in which the electron may exist without radiating electromagnetic energy. In these states, according to Bohr, the angular momentum of electrons takes values that are integer multiples of $\hbar$. In stationary states, the angular momentum of the electron may have magnitude $\hbar, 2\hbar, 3\hbar$ ......, but never such as $2.5\hbar$ or $3.1\hbar$. This is called the quantization of angular momentum.

62. **(d) :** Using $N = N_0\left(\frac{1}{2}\right)^n \Rightarrow \frac{N}{N_0} = \left(\frac{1}{2}\right)^n$

$\Rightarrow \frac{25}{100} = \left(\frac{1}{2}\right)^n \Rightarrow n = 2.$

The total time in which radium change to 25 g is

$= 2 \times 1600 = 3200$ yr.

63. **(c) :** Binding energy $= [NM_m + ZM_P - M(N, Z)]c^2$

64. **(d) :** The charge on hydrogen nucleus $q_1 = +e$ charge on electron, $q_2 = -e$

Coulomb force, $F = K\frac{q_1 q_2}{r^2} = K\frac{(+e)(-e)}{r^2}$

$= -\frac{Ke^2}{r^3}\vec{r} = -\frac{Ke^2}{r^2}\hat{r}.$

65. **(c)**

66. **(d) :** $\frac{\text{Volume of atom}}{\text{Volume of nucleus}} = \frac{\frac{4}{3}\pi(10^{-10})^3}{\frac{4}{3}\pi(10^{-15})^3}$

$= 10^{15}.$

67. **(a) :** Let, $t = 0, M_0 = 10$ g

$t = 2\tau = 2\left(\frac{1}{\lambda}\right)$ (given)

Then from, $M = M_0 e^{-\lambda t} = 10e^{-\lambda\left(\frac{2}{\lambda}\right)}$

$= 10\left(\frac{1}{e}\right)^2 = 1.35$ g.

68. **(a) :** Radius of first orbit, $r \propto \frac{1}{Z}$,

for doubly ionized lithium $Z(= 3)$ will be maximum, hence for doubly ionized lithium r will be minimum.

69. **(c) :** Mass defect $= 2M_P + 2M_N - M_{He}$

$= 2\times1.0073 + 2\times1.0087 - 4.0015 = 0.0305.$

$\Rightarrow$ Binding energy $= (931 \times$ mass defect) MeV

$= 931 \times 0.0305$ MeV $= 28.4$ MeV

(1 amu = 931 Mev).

70. **(c) :** Mass number = atomic number + no. of neutrons

For hydrogen, number of neutrons = 0

So, mass number = Atomic number.

Hence mass number is sometimes equal to atomic number.

71. **(a) :** β-decay.

72. **(a) :** The nuclei of light elements have a lower binding energy than that for the elements of intermediate mass. They are therefore less stable; consequently the fusion of the light elements results in more stable nucleus.

73. **(c) :** Number of initial active nuclei $= 4 \times 10^{16}$

Number of decayed nuclei after 10 days (half life)

$= \frac{4\times10^{16}}{2} = 2\times10^{16}.$

Remaining number of nuclei after 10 days

$= 4 \times 10^{16} - 2 \times 10^{16} = 2 \times 10^{16}.$

$\therefore$ Number of decayed nuclei in next 10 days

$= \frac{2\times10^{16}}{2} = 1\times10^{16}.$

Similarly, number of decayed nuclei in next 10 days $= 0.5 \times 10^{16}$

$\therefore$ Total number of nuclei decayed after 30 days

$= 2 \times 10^{16} + 1 \times 10^{16} + 0.5 \times 10^{16} = 3.5 \times 10^{16}.$

74. **(d) :** The nuclear reaction is

$${}_8O^{16} + {}_1H^2 \rightarrow {}_7N^{14} + {}_2He^4$$

So when a deuteron is bombarded on ${}_8O^{16}$ nucleus then an α-particle (${}_2He^4$) is emitted and the product nucleus is ${}_7N^{14}$.

75. **(a)** : α-rays are positively charged particles.

76. **(a) :** ${}^{10}_{5}B + {}^{1}_{0}n \rightarrow {}^{4}_{2}He + {}^{7}_{3}Li$

77. **(b) :** $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n$ $n \rightarrow$ no. of decays.

$\frac{1}{256} = \left(\frac{1}{2}\right)^8 = \left(\frac{1}{2}\right)^n \quad \therefore n = 8$

Time for 8 half life = 100 hours.

78. **(b) :** $2d\sin\phi = n\lambda$; $(\sin\phi)_{max} = 1$

i.e. $\lambda_{max} = 2d \Rightarrow \lambda_{max}$

$= 2 \times 2.8 \times 10^{-8} = 5.6 \times 10^{-8}$ m.

79. **(a) :** $E \propto \frac{Z^2}{n^2}$

80. **(a)** 81. **(a)** 82. **(c)**

83. **(a) :** $\upsilon \propto \left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$

84. **(a)** 85. **(a)** 86. **(a)**

87. **(b) :** Jump to second orbit leads to Balmer series. The jump from 4th orbit shall give rise to second line of Balmer series.

88. **(d)**

89. **(b,d) :** 1α reduce the mass number by 4 units and atomic number by 2 units, while 1β only increase the atomic number by 1 unit.

90. **(c) :** Balancing the equation.

91. **(d) :** ${}_nX^m \xrightarrow{-1\alpha-2\beta} {}_{n-2+2}Z^{m-4} = {}_nZ^{m-4}.$

92. **(c) :** Let ${}_5B^{10}$ be present as $x\%$ and percentage of ${}_5B^{11} = (100 - x)$

$\therefore$ Average atomic coefficient $= \frac{10x + 11(100 - x)}{100}$

$= 10.81 \Rightarrow x = 19$

$\therefore$ % of ${}_5B^{11}$ is $100 - 19 = 81$. Ratio is 19 : 81.

93. **(a) :** Centripetal force = force of attraction of nucleus on electron

$\frac{mv^2}{a_0} = \frac{1}{4\pi\varepsilon_0}\frac{e^2}{a_0^2}; \quad v = \frac{e}{\sqrt{4\pi\varepsilon_0 a_0 m}}.$

94. **(d) :** Energy $= h\upsilon = \frac{hc}{\lambda} = \frac{6.625\times10^{-34}\times3\times10^8}{21\times10^{-2}}$

$= 0.9464 \times 10^{-24}$ J $\cong 1 \times 10^{-24}$ J.

95. **(a) :** For A, 80 min. = 4 half lives

No. of atoms left $= \frac{N_0}{16}$

For B, 80 min. $\cong$ 2 half lives

No. of atoms left $= \frac{N_0}{4}$. Ratio = 1 : 4.

96. **(c)**

97. **(d) :** In nuclear fission, the chain reaction is controlled in such way that only one neutron, produced in each fission, causes further fission. Therefore some moderator is used to slow down the neutrons. Heavy water is used for this purpose.

98. **(c) :** Energy of the ground electronic state of hydrogen atom $E = -13.6$ eV.

We know that energy of the first excited state for second orbit (where $n = 2$)

$E_n = -\frac{13.6}{(n)^2} = -\frac{13.6}{(2)^2} = -3.4$ eV.

99. **(b) :** When a hydrogen atom is in its excited level, then $n = 2$. Therefore radius of hydrogen atom in its first excited level $(r) \propto n^2 r_0 \propto (2)^2 = 4r_0$.

100. **(b) :** γ-ray are most penetrating radiations.

101. **(b) :** By the law of photo-electric effect $\frac{hc}{\lambda} = eV$

or $\lambda = \frac{hc}{eV} \propto \frac{1}{V}$.

102. **(b) :** Energy of hydrogen atom in ground state $= -13.6$ eV and quantum number $(n) = 2$.

We know that energy of hydrogen atom

$(E_n) = -\frac{13.6}{n^2} = -\frac{13.6}{(2)^2} = -3.4$ eV.

103. **(d) :** According to Bohr's principle, radius of orbit $(r) = 4\pi\varepsilon_0 \times \frac{n^2h^2}{4\pi^2me^2} \propto n^2$. where n = principal quantum number.

104. **(d) :** Velocity ratio $(v_1 : v_2) = 2 : 1$.

Mass $(m) \propto$ Volume $\propto r^3$.

According to law of conservation of momentum,

$m_1v_1 = m_2v_2$

Therefore $\frac{v_1}{v_2} = \frac{m_2}{m_1} = \frac{r_2^3}{r_1^3}$

or $\frac{r_1}{r_2} = \left(\frac{v_2}{v_1}\right)^{1/3} = \left(\frac{1}{2}\right)^{1/3} = \frac{1}{2^{1/3}}$

or $r_1 : r_2 = 1 : 2^{1/3}$.

105. **(b) :** On emission of one α-particle, atomic number decreases by 2 units and atomic mass number decrease by 4 units.

Here, decrease in mass number $= 200 - 168 = 32$.

$\therefore$ Number of α-particles $= 32/4 = 8$.

While the emission of β-particle does not effect the mass number and atomic number increases by 1 unit.

$\therefore$ Number of β-particles $= 16 - 10 = 6$.

106. **(b) :** Number of nucleon on reactant side = 4

Binding energy for one nucleon $= x_1$

Binding energy for 4 nucleons $= 4x_1$

Similarly on product side binding energy $= 4x_2$

Now, Q = change in binding energy $= 4(x_2 - x_1)$.

107. **(a) :** Half-life time = 30 minutes; Rate of decrease $(N) = 5$ per second and total time = 2 hours = 120 minutes. Relation for initial and final count rate

$\frac{N}{N_0} = \left(\frac{1}{2}\right)^{\text{time/half-life}} = \left(\frac{1}{2}\right)^{120/30} = \left(\frac{1}{2}\right)^4 = \frac{1}{16}.$

Therefore $N_0 = 16 \times N = 16 \times 5 = 80\ s^{-1}$.

108. (d) : Transition of hydrogen atom from orbit $n_1 = 4$ to $n_2 = 2$.

Wave number $= \frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$

$= R\left[\frac{1}{(2)^2} - \frac{1}{(4)^2}\right] = R\left[\frac{1}{4} - \frac{1}{16}\right]$

$= R\left[\frac{4-1}{16}\right] = \frac{3R}{16}$.

$\Rightarrow \lambda = 16/3R$.

109. (b) : P.E. $= -\frac{k\,Ze^2}{R}$ and K.E. $= \frac{1}{2}mv^2 = \frac{k\,Ze^2}{2R}$.

Therefore when a hydrogen atom is raised from the ground, it increases the value of the radius R. As a result of this, both K.E. and P.E. decrease.

110. (b)

111. (c) : Absorption spectrum involves only excitation of ground level to higher level. Therefore spectral lines 1, 2, 3 will occur in the absorption spectrum.

112. (b) : Mass number of helium $(A_{He}) = 4$ and mass number of sulphur $(A_S) = 32$.

Radius of nucleus, $r = r_0(A)^{1/3} \propto (A)^{1/3}$. Therefore

$\frac{r_s}{r_{He}} = \left(\frac{A_s}{A_{He}}\right)^{1/3} = \left(\frac{32}{4}\right)^{1/3} = (8)^{1/3} = 2.$

113. (b) : From binding energy curve, the curve reaches peak for $_{26}Fe^{56}$.

114. (b) : Neon street sign is a source of line emission spectrum.

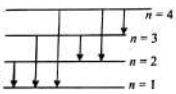
115. (b) : Fission rate

$= \frac{\text{total power}}{\frac{\text{energy}}{\text{fission}}} = \frac{5}{200 \times 1.6 \times 10^{-13}} = 1.56 \times 10^{11}\ s^{-1}$

116. (b) :

No. of spectral lines

$= \frac{n(n-1)}{2} = \frac{4(4-1)}{2} = 6$



117. (a) : As $r \propto n^2$, therefore, radius of 2nd Bohr's orbit $= 4a_0$

118. (a) : Fusion reaction.

119. (d) : $E = E_4 - E_3$

$= -\frac{13.6}{4^2} - \left(-\frac{13.6}{3^2}\right) = -0.85 + 1.51 = 0.66\ \text{eV}$

120. (c) : 1 a.m.u = 931 MeV

121. (a) : α-particle $= {}_2He^4$. It contains 2 p and 2 n. As some mass is converted into binding energy, therefore, mass of α particle is slightly less than sum of the masses of 2p and 2n.

122. (d) : Clearly C and N^+ have same electronic configuration as they are isoelectronic.

123. (c) : The nuclear radius r varies with mass number A according to the relation

$r = r_0 A^{1/3} \Rightarrow r \propto A^{1/3}$ or $A \propto r^3$

Now density $= \frac{\text{mass}}{\text{volume}}$

Further mass $\propto A$ and volume $\propto r^3$

$\therefore \frac{\text{mass}}{\text{volume}} = \text{constant}$

124. (a) : Nucleus contains only neutrons and protons

125. (d) : $\frac{N}{N_0} = \left(\frac{1}{2}\right)^{6400/1600} = \left(\frac{1}{2}\right)^4 = \frac{1}{16}$

126. (a) : $Z = 11$ *i.e.*, number of protons $= 11$, $A = 23$

$\therefore$ Number of neutrons $= A - Z = 12$

Number of electron = 0 (No electron in nucleus)

Therefore 11, 12, 0.

127. (a) : Second excited state corresponds to $n = 3$

$\therefore E = \frac{13.6}{3^2}\text{eV} = 1.51\ \text{eV}$

but one has to ionise only from ground state. Even if one has to excite an atom from $n = 3$, one has to excite from $n = 1$.

128. (c) : Nuclear force is the same between any two nucleons

129. (c) : For all first group elements, Na, K, Rb, Cs, Fr. They have one electron in the s subsell.

130. (d) : The circumference of an orbit in an atom in terms of wavelength of wave associated with electron is given by the relation,

Circumference $= n\lambda$

where $n = 1, 2, 3, \ldots$

131. (a) : As $_6C^{13}$ and $_7N^{14}$ have same no. of neutrons $(13 - 6 = 7$ for C and $14 - 7 = 7$ for N), they are isotones.

132. (c) : Nuclear forces are short range forces

133. (a) : $R \propto (A)^{1/3}$ from $R = R_0 A^{1/3}$.

$\therefore R_{Al} \propto (27)^{1/3}$ and $R_{Te} \propto (125)^{1/5}$

$\therefore \frac{R_{Al}}{R_{Te}} = \frac{3}{5} = \frac{6}{10}$

134. (b) : $_6C^{12} + {}_0n^1 \rightarrow {}_6C^{13} \rightarrow {}_7N^{13} + {}_{-1}\beta^0$ + Energy

135. (d) : Number of half lives, $n = \frac{t}{T} = \frac{6400}{800} = 8$

$\frac{N}{N_0} = \left(\frac{1}{2}\right)^8 = \frac{1}{256}$

136. (a) : From equation (ii), B has 2 units of charge more than C.

From equation (i), A loses 2 units of charge by emission of alpha particle. Hence, A and C are isotopes as their charge number is same.

137. (c) : Curie is a unit of radioactivity

138. (a) : Average binding energy/nucleon in nuclei is of the order of 8 MeV.

139. (b) : Bohr used quantisation of angular momentum. For stationary orbits, Angular momentum $I\omega = \frac{nh}{2\pi}$ where $n = 1, 2, 3, \ldots$etc.

140. (d)

141. (d) : In two half lives, the activity becomes one fourth.

Activity on 1 - 8 - 91 was 2 micro curie

$\therefore$ Activity before two months,

4×2 micro-Curie = 8 micro curie

142. (d) : Two successive β decays increase the charge no. by 2.

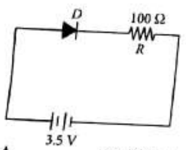
143. (d) : $E \propto Z^2$ and Z for singly ionised helium is 2 (*i.e.*, 2 protons in the nucleus)

$\therefore (E)_{He} = 4 \times 13.6 = 54.4$ eV.

21 Semiconductor Electronics : Materials, Devices and Simple Circuits

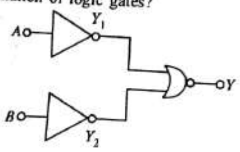
1. The input signal given to a CE amplifier having a voltage gain of 150 is $V_i = 2\cos\left(15t + \frac{\pi}{3}\right)$. The corresponding output signal will be
(a) $2\cos\left(15t + \frac{5\pi}{6}\right)$
(b) $300\cos\left(15t + \frac{4\pi}{3}\right)$
(c) $300\cos\left(15t + \frac{\pi}{3}\right)$
(d) $75\cos\left(15t + \frac{2\pi}{3}\right)$
(AIPMT 2015)

2. In the given figure, a diode D is connected to an external resistance $R = 100\ \Omega$ and an e.m.f. of 3.5 V. If the barrier potential developed across the diode is 0.5 V, the current in the circuit will be



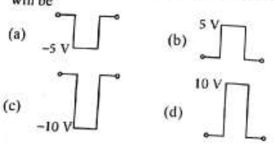
(a) 20 mA
(b) 35 mA
(c) 30 mA
(d) 40 mA
(AIPMT 2015)

3. Which logic gate is represented by the following combination of logic gates?



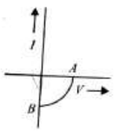
(a) AND
(b) NOR
(c) OR
(d) NAND
(AIPMT 2015, Cancelled)

4. If in a p–n junction, a square input signal of 10 V is applied, as shown, then the output across R_L will be



(AIPMT 2015, Cancelled)

5. The given graph represents V-I characteristic for a semiconductor device.



Which of the following statement is correct?
(a) It is V-I characteristic for solar cell where, point A represents open circuit voltage and point B short circuit current.
(b) It is for a solar cell and points A and B represent open circuit voltage and current, respectively.
(c) It is for a photodiode and points A and B represent open circuit voltage and current, respectively.
(d) It is for a LED and points A and B represent open circuit voltage and short circuit current, respectively. *(AIPMT 2014)*

6. The barrier potential of a p-n junction depends on
(1) type of semiconductor material
(2) amount of doping
(3) temperature
Which one of the following is correct?
(a) (1) and (2) only
(b) (2) only
(c) (2) and (3) only
(d) (1), (2) and (3)
(AIPMT 2014)

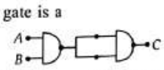
7. In a common emitter (CE) amplifier having a voltage gain G, the transistor used has transconductance 0.03 mho and current gain 25. If the above transistor is replaced with another one with transconductance 0.02 mho and current gain 20, the voltage gain will be
(a) $\frac{1}{3}G$
(b) $\frac{5}{4}G$
(c) $\frac{2}{3}G$
(d) 1.5G *(NEET 2013)*

8. In a n-type semiconductor, which of the following statement is true.
(a) Holes are minority carriers and pentavalent atoms are dopants.
(b) Holes are majority carriers and trivalent atoms are dopants.
(c) Electrons are majority carriers and trivalent atoms are dopants.
(d) Electrons are minority carriers and pentavalent atoms are dopants.
(NEET 2013)

9. The output (X) of the logic circuit shown in figure will be

(a) $X = A.B$
(b) $X = \overline{A + B}$
(c) $X = \overline{\bar{A}.\bar{B}}$
(d) $X = \overline{A.B}$
(NEET 2013)

10. The output from a NAND gate is divided into two in parallel and fed to another NAND gate. The resulting gate is a

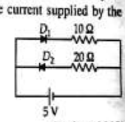


(a) AND gate
(b) NOR gate
(c) OR gate
(d) NOT gate
(Karnataka NEET 2013)

11. One way in which the operation of a n-p-n transistor differs from that of a p-n-p
(a) The emitter junction injects minority carriers into the base region of the p-n-p
(b) The emitter injects holes into the base of the p-n-p and electrons into the base region of n-p-n
(c) The emitter injects holes into the base of n-p-n
(d) The emitter junction is reversed biased in n-p-n
(Karnataka NEET 2013)

12. In an unbiased p-n junction, holes diffuse from the p-region to n-region because of
(a) The attraction of free electrons of n-region.
(b) The higher hole concentration in p-region than that in n-region.
(c) The higher concentration of electrons in the n-region than that in the p-region.
(d) The potential difference across the p-n junction.
(Karnataka NEET 2013)

13. Two ideal diodes are connected to a battery as shown in the circuit. The current supplied by the battery is



(a) 0.75 A
(b) zero
(c) 0.25 A
(d) 0.5 A
(Prelims 2012)

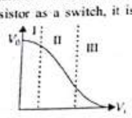
14. In a CE transistor amplifier, the audio signal voltage across the collector resistance of 2 kΩ is 2 V. If the base resistance is 1 kΩ and the current amplification of the transistor is 100, the input signal voltage is
(a) 0.1 V
(b) 1.0 V
(c) 1 mV
(d) 10 mV *(Prelims 2012)*

15. C and Si both have same lattice structure; having 4 bonding electrons in each. However, C is insulator where as Si is intrinsic semiconductor. This is because
(a) In case of C the valence band is not completely filled at absolute zero temperature.
(b) In case of C the conduction band is partly filled even at absolute zero temperature.

(c) The four bonding electrons in the case of C lie in the second orbit, whereas in the case of Si they lie in the third.

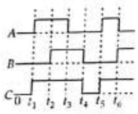
(d) The four bonding electrons in the case of C lie in the third orbit, whereas for Si they lie in the fourth orbit. *(Prelims 2012)*

16. Transfer characteristics [output voltage (V_0) vs input voltage (V_i)] for a base biased transistor in CE configuration is as shown in the figure. For using transistor as a switch, it is used



(a) in region III
(b) both in region (I) and (III)
(c) in region II
(d) in region I *(Prelims 2012)*

17. The figure shows a logic circuit with two inputs A and B and the output C. The voltage wave forms across A, B and C are as given. The logic circuit gate is



(a) OR gate (b) NOR gate
(c) AND gate (d) NAND gate
(Prelims 2012)

18. The input resistance of a silicon transistor is 100 Ω. Base current is changed by 40 μA which results in a change in collector currently by 2 mA. This transistor is used as a common emitter amplifier with a load resistance of 4 kΩ. The voltage gain of the amplifier is

(a) 2000 (b) 3000
(c) 4000 (d) 1000 *(Mains 2012)*

19. To get an output $Y = 1$ in given circuit which of the following input will be correct?

	A	B	C
(a)	1	0	0
(b)	1	0	1
(c)	1	1	0
(d)	0	1	0

(Mains 2012)

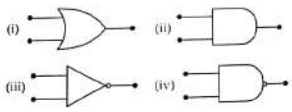
20. A transistor is operated in common emitter configuration at $V_C = 2$ V such that a change in the base current from 100 μA to 300 μA produces a change in the collector current from 10 mA to 20 mA. The current gain is

(a) 50 (b) 75
(c) 100 (d) 25 *(Prelims 2011)*

21. In forward biasing of the p-n junction

(a) the positive terminal of the battery is connected to p-side and the depletion region becomes thick.
(b) the positive terminal of the battery is connected to n-side and the depletion region becomes thin.
(c) the positive terminal of the battery is connected to n-side and the depletion region becomes thick.
(d) the positive terminal of the battery is connected to p-side and the depletion region becomes thin. *(Prelims 2011)*

22. Symbolic representation of four logic gates are shown as



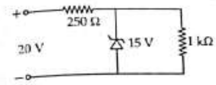
Pick out which ones are for AND, NAND and NOT gates, respectively

(a) (ii), (iii) and (iv) (b) (iii), (ii) and (i)
(c) (iii), (ii) and (iv) (d) (ii), (iv) and (iii)
(Prelims 2011)

23. If a small amount of antimony is added to germanium crystal

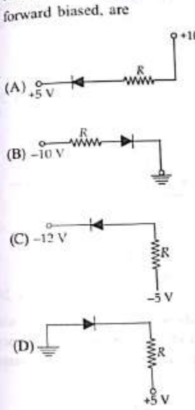
(a) it becomes a p-type semiconductor
(b) the antimony becomes an acceptor atom
(c) there will be more free electrons than holes in the semiconductor
(d) its resistance is increased *(Prelims 2011)*

24. A Zener diode, having breakdown voltage equal to 15V, is used in a voltage regulator circuit shown in figure. The current through the diode is



(a) 5 mA (b) 10 mA
(c) 15 mA (d) 20 mA
(Mains 2011)

25. In the following figure, the diodes which are forward biased, are



(a) (A), (B) and (D) (b) (C) only
(c) (C) and (A) (d) (B) and (D)
(Mains 2011)

26. Pure Si at 500 K has equal number of electron (n_e) and hole (n_h) concentrations of 1.5×10^{16} m^{-3}. Doping by indium increases n_h to 4.5×10^{22} m^{-3}. The doped semiconductor is of

(a) p-type having electron concentration $n_e = 5 \times 10^{9}$ m^{-3}
(b) n-type with electron concentration $n_e = 5 \times 10^{22}$ m^{-3}
(c) p-type with electron concentration $n_e = 2.5 \times 10^{10}$ m^{-3}
(d) n-type with electron concentration $n_e = 2.5 \times 10^{23}$ m^{-3}
(Mains 2011)

27. Which one of the following statement is false?

(a) Pure Si doped with trivalent impurities gives a p-type semiconductor.
(b) Majority carriers in a n-type semiconductor are holes.
(c) Minority carriers in a p-type semiconductor are electrons.
(d) The resistance of intrinisic semiconductor decreases with increase of temperature.

(Prelims 2010)

28. Which one of the following bonds produces a solid that reflects light in the visible region and whose electrical conductivity decreases with temperature and has high melting point?

(a) metallic bonding
(b) van der Waal's bonding
(c) ionic bonding
(d) covalent bonding *(Prelims 2010)*

29. The device that can act as a complete electronic circuit is

(a) junction diode (b) integrated circuit
(c) junction transistor
(d) zener diode *(Prelims 2010)*

30. A common emitter amplifier has a voltage gain of 50, an input impedance of 100 Ω and an output impedance of 200 Ω. The power gain of the amplifier is

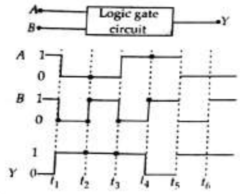
(a) 500 (b) 1000
(c) 1250 (d) 50 *(Prelims 2010)*

31. To get an output Y = 1 from the circuit shown below, the input must be

	A	B	C
(a)	0	1	0
(b)	0	0	1
(c)	1	0	1
(d)	1	0	0

(Prelims 2010)

32. The following figure shows a logic gate circuit with two inputs A and B and the output Y. The voltage waveforms of A, B and Y are as given.



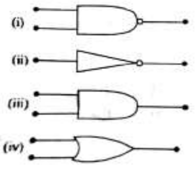
The logic gate is
(a) NOR gate (b) OR gate
(c) AND gate (d) NAND gate *(Mains 2010)*

33. For transistor action
(1) Base, emitter and collector regions should have similar size and doping concentrations.
(2) The base region must be very thin and lightly doped.
(3) The emitter-base junction is forward biased and base-collector junction is reverse biased.
(4) Both the emitter-base junction as well as the base-collector junction are forward biased.
Which one of the following pairs of statements is correct?
(a) (4) and (1) (b) (1) and (2)
(c) (2) and (3) (d) (3) and (4) *(Mains 2010)*

34. A p-n photodiode is fabricated from a semiconductor with a band gap of 2.5 eV. It can detect a signal of wavelength
(a) 4000 nm (b) 6000 nm
(c) 4000 Å (d) 6000 Å *(Prelims 2009)*

35. The symbolic representation of four logic gates are given below

(i) (ii) (iii) (iv)

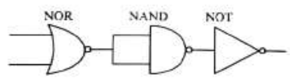


The logic symbols for OR, NOT and NAND gates are respectively
(a) (iv), (i), (iii) (b) (iv), (ii), (i)
(c) (i), (iii), (iv) (d) (iii), (iv), (ii) *(Prelims 2009)*

36. A transistor is operated in common-emitter configuration at $V_C = 2$ V such that a change in the base current from 100 μA to 200 μA produces a change in the collector current from 5 mA to 10 mA. The current gain is
(a) 100 (b) 150
(c) 50 (d) 75 *(Prelims 2009)*

37. Sodium has body centred packing. Distance between two nearest atoms is 3.7 Å. The lattice parameter is
(a) 4.3 Å (b) 3.0 Å
(c) 8.6 Å (d) 6.8 Å *(Prelims 2009)*

38. The circuit



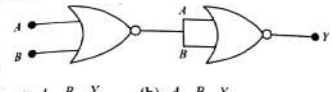
is equivalent to
(a) NOR gate (b) OR gate
(c) AND gate (d) NAND gate *(Prelims 2008)*

39. A p-n photodiode is made of a material with a band gap of 2.0 eV. The minimum frequency of the radiation that can be absorbed by the material is nearly
(a) 1×10^{14} Hz (b) 20×10^{14} Hz
(c) 10×10^{14} Hz (d) 5×10^{14} Hz *(Prelims 2008)*

40. If the lattice parameter for a crystalline structure is 3.6 Å, then the atomic radius in fcc crystal is
(a) 2.92 Å (b) 1.27 Å
(c) 1.81 Å (d) 2.10 Å *(Prelims 2008)*

41. The voltage gain of an amplifier with 9% negative feedback is 10. The voltage gain without feedback will be
(a) 1.25 (b) 100
(c) 90 (d) 10 *(Prelims 2008)*

42. In the following circuit, the output Y for all possible inputs A and B is expressed by the truth table.



(a)

A	B	Y
0	0	1
0	1	1
1	0	1
1	1	0

(b)

A	B	Y
0	0	1
0	1	0
1	0	0
1	1	0

(c)

A	B	Y
0	0	0
0	1	1
1	0	1
1	1	1

(d)

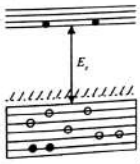
A	B	Y
0	0	0
0	1	0
1	0	0
1	1	1

(2007)

43. A common emitter amplifier has a voltage gain of 50, an input impedance of 100 Ω and an output impedence of 200 Ω. The power gain of the amplifier is
(a) 1000 (b) 1250
(c) 100 (d) 500. *(2007)*

44. For a cubic crystal structure which one of the following relations indicating the cell characteristics is correct?
(a) $a \neq b \neq c$ and $\alpha = \beta = \gamma = 90°$
(b) $a = b = c$ and $\alpha \neq \beta \neq \gamma = 90°$
(c) $a = b = c$ and $\alpha = \beta = \gamma = 90°$
(d) $a \neq b \neq c$ and $\alpha \neq \beta$ and $\gamma \neq 90°$. *(2007)*

45. In the energy band diagram of a material shown below, the open circles and filled circles denote holes and electrons respectively. The material is



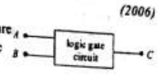
(a) an insulator (b) a metal
(c) an n-type semiconductor
(d) a p-type semiconductor. *(2007)*

46. A forward biased diode is
(a) 
(b) 

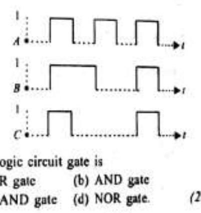
(c) 

(d) 
(2006)

47. The following figure shows a logic gate circuit with two inputs A and B and the output C.



The voltage waveforms of A, B and C are as shown below.



The logic circuit gate is
(a) OR gate (b) AND gate
(c) NAND gate (d) NOR gate. *(2006)*

48. A transistor is operated in common emitter configuration at constant collector voltage $V_C = 1.5$ V such that a change in the base current from 100 μA to 150 μA produces a change in the collector current from 5 mA to 10 mA. The current gain β is
(a) 50 (b) 67
(c) 75 (d) 100. *(2006)*

49. Choose the only false statement from the following.
(a) In conductors the valence and conduction bands overlap.
(b) Substances with energy gap of the order of 10 eV are insulators.
(c) The resistivity of a semiconductor increases with increase in temperature.
(d) The conductivity of a semiconductor increases with increase in temperature. *(2005)*

50. Zener diode is used for
(a) amplification (b) rectification
(c) stabilisation
(d) producing oscillations in an oscillator. *(2005)*

51. Application of a forward bias to a *p-n* junction
(a) widens the depletion zone
(b) increases the potential difference across the depletion zone
(c) increases the number of donors on the *n* side
(d) decreases the electric field in the depletion zone. *(2005)*

52. Carbon, silicon and germanium atoms have four valence electrons each. Their valence and conduction bands are separated by energy band gaps represented by $(E_g)_C$, $(E_g)_{Si}$ and $(E_g)_{Ge}$ respectively. Which one of the following relationships is true in their case?
(a) $(E_g)_C > (E_g)_{Si}$ (b) $(E_g)_C < (E_g)_{Si}$
(c) $(E_g)_C = (E_g)_{Si}$ (d) $(E_g)_C < (E_g)_{Ge}$. *(2005)*

53. Copper has face centered cubic (fcc) lattice with interatomic spacing equal to 2.54 Å. The value of lattice constant for this lattice is
(a) 2.54 Å (b) 3.59 Å
(c) 1.27 Å (d) 5.08 Å. *(2005)*

54. In a *p-n* junction photo cell, the value of the photo-electromotive force produced by monochromatic light is proportional to
(a) The barrier voltage at the *p-n* junction.
(b) The intensity of the light falling on the cell.
(c) The frequency of the light falling on the cell.
(d) The voltage applied at the *p-n* junction. *(2005)*

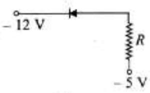
55. In semiconductors at a room temperature
(a) the valence band is partially empty and the conduction band is partially filled
(b) the valence band is completely filled and the conduction band is partially filled
(c) the valence band is completely filled
(d) the conduction band is completely empty *(2004)*

56. The peak voltage in the output of a half wave diode rectifier fed with a sinusoidal signal without filter is 10 V. The d.c. component of the output voltage is
(a) $10/\sqrt{2}$ V (b) $10/\pi$ V
(c) 10 V (d) $20/\pi$ V *(2004)*

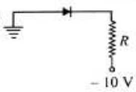
57. The output of OR gate is 1
(a) if both inputs are zero
(b) if either or both inputs are 1
(c) only if both inputs are 1
(d) if either input is zero *(2004)*

58. Of the diodes shown in the following diagrams, which one is reverse biased ?

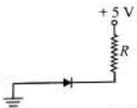
(a)



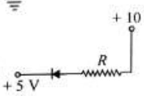
(b)



(c)



(d)



(2004)

59. Reverse bias applied to a junction diode
(a) lowers the potential barrier
(b) raises the potential barrier
(c) increases the majority carrier current
(d) increases the minority carrier current *(2003)*

60. A *n-p-n* transistor conducts when
(a) both collector and emitter are positive with respect to the base
(b) collector is positive and emitter is negative with respect to the base
(c) collector is positive and emitter is at same potential as the base
(d) both collector and emitter are negative with respect to the base *(2003)*

61. If a full wave rectifier circuit is operating from 50 Hz mains, the fundamental frequency in the ripple will be
(a) 25 Hz (b) 50 Hz
(c) 70.7 Hz (d) 100 Hz *(2003)*

62. Barrier potential of a *p-n* junction diode does not depend on
(a) diode design (b) temperature
(c) forward bias (d) doping density *(2003)*

63. Following diagram performs the logic function of

(a) AND gate (b) NAND gate
(c) OR gate (d) XOR gate *(2003)*

64. Number of atom per unit cell in B.C.C.
(a) 9 (b) 4
(c) 2 (d) 1. *(2002)*

65. For a transistor $\frac{I_C}{I_E} = 0.96$, then current gain for common emitter is
(a) 12 (b) 6
(c) 48 (d) 24. *(2002)*

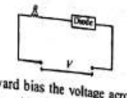
66. In a *pn* junction
(a) high potential at *n* side and low potential at *p* side
(b) high potential at *p* side and low potential at *n* side
(c) *p* and *n* both are at same potential
(d) undetermined. *(2002)*

67. The given truth table is for which logic gate

A	*B*	*Y*
1	1	0
0	1	1
1	0	1
0	0	1

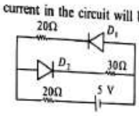
(a) NAND
(b) XOR
(c) NOR
(d) OR. *(2002, 2001, 1998, 94)*

68. For the given circuit of *p-n* junction diode which is correct



(a) in forward bias the voltage across *R* is *V*
(b) in reverse bias the voltage across *R* is *V*
(c) in forward bias the voltage across *R* is 2*V*
(d) in reverse bias the voltage across *R* is 2*V*. *(2002)*

69. The current in the circuit will be



(a) 5/40 A (b) 5/50 A
(c) 5/10 A (d) 5/20. A *(2001)*

70. For a common base circuit if $\frac{I_C}{I_E} = 0.98$ then current gain for common emitter circuit will be
(a) 49 (b) 98
(c) 4.9 (d) 25.5. *(2001)*

71. The cations and anions are arranged in alternate form in
(a) metallic crystal (b) ionic crystal
(c) covalent crystal
(d) semi-conductor crystal. *(2000)*

72. From the following diode circuit, which diode is in forward biased condition

(a)

(b)

(c)

(d)

(2000)

73. The correct relation for α, β for a transistor
(a) $\beta = \frac{1-\alpha}{\alpha}$ (b) $\beta = \frac{\alpha}{1-\alpha}$
(c) $\alpha = \frac{\beta-1}{\beta}$ (d) $\alpha\beta = 1$. *(2000)*

74. A p-n junction diode can be used as
(a) condenser (b) regulator
(c) amplifier (d) rectifier *(1999)*

75. Sodium has body-centred packing. If the distance between two nearest atoms is 3.7 Å, then lattice parameter is
(a) 4.3 Å (b) 3.9 Å
(c) 3.3 Å (d) 4.8 Å *(1999)*

76. In a p type semiconductor, the majority carriers of current are
(a) protons (b) electrons
(c) holes (d) neutrons *(1999)*

77. In forward bias, the width of potential barrier in a p-n junction diode
(a) remains constant (b) decreases
(c) increases (d) first (a) then (b) *(1999)*

78. Depletion layer consists of
(a) mobile ions (b) protons
(c) electrons (d) immobile ions *(1999)*

79. In a junction diode, the holes are due to
(a) extra electrons
(b) neutrons
(c) protons
(d) missing of electrons *(1999)*

80. Which of the following, when added as an impurity into the silicon produces n type semiconductor?
(a) B (b) Al
(c) P (d) Mg *(1999)*

81. The cause of the potential barrier in a p-n diode is
(a) depletion of negative charges near the junction
(b) concentration of positive charges near the junction
(c) depletion of positive charges near the junction
(d) concentration of positive and negative charges near the junction *(1998)*

82. Which of the following gates will have an output of 1?

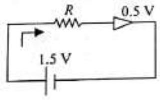
(a) 
(b) 

(c) 

(d) 

(1998)

83. The transfer ratio β of a transistor is 50. The input resistance of the transistor when used in the common-emitter configuration is 1 kΩ. The peak value of the collector A.C. current for an A.C. input voltage of 0.01 V peak is



(a) 0.25 mA (b) 0.01 mA
(c) 100 μA (d) 500 μA *(1998)*

84. A semiconducting device is connected in a series circuit with a battery and a resistance. A current is found to pass through the circuit. If the polarity of the battery is reversed, the current drops to almost zero. The device may be
(a) a p type semiconductor
(b) an intrinsic semiconductor
(c) a p-n junction
(d) an n type semiconductor *(1998)*

85. The diode used in the circuit shown in the figure has a constant voltage drop at 0.5 V at all currents and a maximum power rating of 100 milli watts. What should be the value of the resistor R, connected in series with diode for obtaining maximum current?
(a) 6.76 Ω (b) 20 Ω
(c) 5 Ω (d) 5.6 Ω. *(1997)*

86. The correct relationship between the two current gains α and β in a transistor is
(a) $\alpha = \frac{\beta}{1+\beta}$ (b) $\alpha = \frac{1+\beta}{\beta}$
(c) $\beta = \frac{\alpha}{1+\alpha}$ (d) $\beta = \frac{\alpha}{\alpha-1}$. *(1997)*

87. The following truth-table belongs to which one of the following four gates?

A	B	Y
1	1	0
1	0	0
0	1	0
0	0	1

(a) XOR (b) NOR
(c) OR (d) NAND *(1997, 95)*

88. To obtain a p-type germanium semiconductor, it must be doped with
(a) indium (b) phosphorus
(c) arsenic (d) antimony. *(1997)*

89. When npn transistor is used as an amplifier, then
(a) electrons move from collector to base
(b) holes move from base to emitter
(c) electrons move from base to collector
(d) electrons move from emitter to base. *(1996)*

90. When arsenic is added as an impurity to silicon, the resulting material is
(a) n-type conductor
(b) n-type semiconductor
(c) p-type semiconductor
(d) none of these. *(1996)*

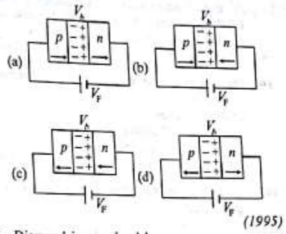
91. When using a triode, as an amplifier, the electrons are emitted by
(a) grid and collected by cathode only
(b) cathode and collected by the anode only
(c) anode and collected by cathode only
(d) anode and collected by the grid and by cathode. *(1996)*

92. This symbol represents

(a) AND gate (b) NOR gate
(c) NAND gate (d) OR gate. *(1996)*

93. Distance between body centred atom and a corner atom in sodium (a = 4.225 Å) is
(a) 2.99 Å (b) 2.54 Å
(c) 3.66 Å (d) 3.17 Å. *(1995)*

94. In the case of forward biasing of p-n junction, which one of the following figures correctly depicts the direction of flow of carriers?



(1995)

95. Diamond is very hard because
(a) it is covalent solid
(b) it has large cohesive energy
(c) high melting point
(d) insoluble in all solvents *(1993)*

96. The part of the transistor which is heavily doped to produce large number of majority carriers is
(a) emitter
(b) base
(c) collector
(d) any of the above depending upon the nature of transistor *(1993)*

97. Which one of the following is the weakest kind of the bonding in solids?
(a) ionic (b) metallic
(c) van der Waals (d) covalent *(1992)*

98. For amplification by a triode, the signal to be amplified is given to
(a) the cathode
(b) the grid
(c) the glass envelope
(d) the anode *(1992)*

99. For an electronic valve, the plate current I and plate voltage V in the space charge limited region are related as
(a) I is proportional to $V^{3/2}$
(b) I is proportional to $V^{2/3}$
(c) I is proportional to V
(d) I is proportional to V^2 *(1992)*

100. A piece of copper and other of germanium are cooled from the room temperature to 80 K, then
(a) resistance of each will increase
(b) resistance of copper will decrease

(c) the resistance of copper will increase while that of germanium will decrease
(d) the resistance of copper will decrease while that of germanium will increase *(1992)*

101. The depletion layer in the p-n junction region is caused by
(a) drift of holes
(b) diffusion of charge carriers
(c) migration of impurity ions
(d) drift of electrons. *(1991)*

102. The following truth table corresponds to the logical gate

A	B	Y
0	0	0
0	1	1
1	0	1
1	1	1

(a) NAND (b) OR
(c) AND (d) XOR. *(1991)*

103. To use a transistor as an amplifier
(a) the emitter base junction is forward biased and the base collector junction is reversed biased
(b) no bias voltage is required
(c) both junction are forward biased
(d) both junction are reverse biased. *(1991)*

104. In a common base amplifier the phase difference between the input signal voltage and the output voltage is
(a) 0 (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{2}$ (d) π. *(1990)*

105. When a triode is used as an amplifier the phase difference between the input signal voltage and the output is
(a) 0 (b) π
(c) $\pi/2$ (d) $\pi/4$. *(1990)*

106. When n type semiconductor is heated
(a) number of electrons increases while that of holes decreases
(b) number of holes increases while that of electrons decreases
(c) number of electrons and holes remain same
(d) number of electrons and holes increases equally. *(1989)*

107. Radiowaves of constant amplitude can be generated with
(a) FET (b) filter
(c) rectifier (d) oscillator. *(1989)*

108. p-n junction is said to be forward biased, when
(a) the positive pole of the battery is joined to the p-semiconductor and negative pole to the n-semiconductor
(b) the positive pole of the battery is joined to the n-semiconductor and p-semiconductor
(c) the positive pole of the battery is connected to n-semiconductor and p-semiconductor
(d) a mechanical force is applied in the forward direction. *(1988)*

109. At absolute zero, Si acts as
(a) non metal (b) metal
(c) insulator (d) none of these. *(1988)*

EXPLANATIONS

1. **(b)** :Here,

Input signal, $V_i = 2\cos\left(15t + \frac{\pi}{3}\right)$

and voltage gain, $A_v = 150$

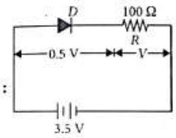
As $A_v = \frac{V_o}{V_i}$

$\therefore$ Output signal, $V_o = A_v V_i$

Since CE amplifier gives a phase difference of $\pi(=180°)$ between input and output signals,

$$\therefore \quad V_o = 150\left[2\cos\left(15t + \frac{\pi}{3} + \pi\right)\right]$$
$$= 300\cos\left(15t + \frac{4\pi}{3}\right)$$

2. **(c)** :



The potential difference across the resistance R is

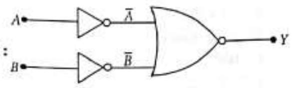
$V = 3.5\ \text{V} - 0.5\ \text{V} = 3\ \text{V}$

By Ohm's law,

The current in the circuit is

$$I = \frac{V}{R} = \frac{3\ \text{V}}{100\ \Omega}$$
$$= 3 \times 10^{-2}\ \text{A} = 30 \times 10^{-3}\ \text{A} = 30\ \text{mA}$$

3. **(a)** :



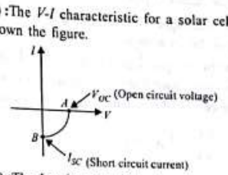
The Boolean expression of this arrangement is

$Y = \overline{\bar{A} + \bar{B}} = \bar{\bar{A}} \cdot \bar{\bar{B}} = A \cdot B$

Thus, the combination represents AND gate.

4. **(b)** :Diode is forward bias for positive voltage *i.e.* $V > 0$, so output across R_L is given by

5. **(a)** :The V-I characteristic for a solar cell is as shown the figure.



6. **(d)** :The barrier potential depends on type of semiconductor (For Si, $V_b = 0.7$ V and for Ge, $V_b = 0.3$ V), amount of doping and also on the temperature.

7. **(c)** :Voltage gain = Current gain × Resistance gain

$$A_v = \beta \times \frac{R_{out}}{R_{in}}$$

Transconductance, $g_m = \frac{\beta}{R_{in}}$ or $R_{in} = \frac{\beta}{g_m}$

$\therefore A_v = g_m R_{out}$

For first case, $A_v = G$, $g_m = 0.03$ mho, $\beta = 25$

$\therefore G = 0.03 R_{out}$ ...(i)

For second case, $A_v = G'$, $g_m = 0.02$ mho, $\beta = 20$

$\therefore G' = 0.02 R_{out}$ ...(ii)

Divide (ii) by (i), we get

$$\frac{G'}{G} = \frac{2}{3} \text{ or } G' = \frac{2}{3}G$$

8. **(a)** :In n-type semiconductor, electrons are majority charge carriers and holes are minority charge carriers and pentavalent atoms are dopants.

9. **(a)** :

The output of the given logic circuit is

$X = \overline{\overline{A.B}} = A.B$

10. **(a)** :

The output of the given logic gate is

$C = \overline{\overline{A \cdot B}} = A \cdot B$

It is the Boolean expression AND gate.
Hence, the resulting gate is a AND gate.

11. **(b)** :The emitter injects electrons into the base region of the n-p-n transistor and holes into the base region of p-n-p transistor.

12. **(b)** :The higher hole concentration is in p-region than that in n-region.

13. **(d)** :In the given circuit the upper diode D_1 is forward biased and the lower diode D_2 is reverse biased. So, the current supplied by the battery is

$$I = \frac{5\text{ V}}{10\,\Omega} = \frac{1}{2}\text{ A} = 0.5\text{ A}$$

14. **(d)** :Here, $R_C = 2\text{ k}\Omega = 2 \times 10^3\,\Omega$

$V_o = 2\text{ V}$

$R_B = 1\text{ k}\Omega = 1 \times 10^3\,\Omega$

$\beta = 100$

Output voltage, $V_o = I_C R_C$

or $I_C = \frac{V_o}{R_C} = \frac{2\text{ V}}{2 \times 10^3\,\Omega} = 10^{-3}\text{ A} = 1\text{ mA}$

As $\beta = \frac{I_C}{I_B}$ or $I_B = \frac{I_C}{\beta}$

$$I_B = \frac{10^{-3}\text{ A}}{100} = 10^{-5}\text{ A}$$

Input voltage, $V_i = I_B R_B = (10^{-5}\text{ A})(1 \times 10^3\,\Omega)$

$= 10^{-2}\text{ V} = 10\text{ mV}$

15. **(c)** :The electronic configuration of carbon (^{6}C) is $1s^2\,2s^2\,2p^2$. The electronic configuration of silicon (^{14}Si) is $1s^2\,2s^2\,2p^6\,3s^2\,3p^2$.
Hence, the four bonding electrons of C and Si respectively lie in second and third orbit.

16. **(b)** :In the given graph,
Region (I) – Cutoff region
Region (II) – Active region
Region (III) – Saturation region
Using transistor as a switch it is used in cutoff region or saturation region.
Using transistor as a amplifier it is used in active region.

17. **(a)** :The truth table of the given waveform is as shown in the table.

Time interval	Input A	Input B	Output C
0 to t_1	0	0	0
t_1 to t_2	1	0	1
t_2 to t_3	1	1	1
t_3 to t_4	0	1	1
t_4 to t_5	0	0	0
t_5 to t_6	1	0	1
$> t_6$	0	1	1

The logic circuit is OR gate.

18. **(a)** :Here,
Input resistance, $R_i = 100\,\Omega$
Change in base current, $\Delta I_B = 40\,\mu\text{A}$
Change in collector current, $\Delta I_C = 2\text{ mA}$
Load resistance, $R_L = 4\text{ k}\Omega = 4 \times 10^3\,\Omega$

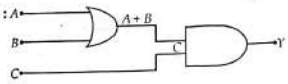
Current gain, $\beta = \frac{\Delta I_C}{\Delta I_B} = \frac{2\text{ mA}}{40\,\mu\text{A}}$

$$= \frac{2 \times 10^{-3}\text{ A}}{40 \times 10^{-6}\text{ A}} = 50$$

Voltage gain of the amplifier is

$$A_V = \beta\frac{R_L}{R_i} = 50 \times \frac{4 \times 10^3}{100} = 2000$$

19. **(b)** :



The Boolean expression of the given circuit is
$Y = (A + B)\cdot C$
The table truth of the given inputs is as shown in the table.

Inputs			Output
A	B	C	$Y = (A + B)\cdot C$
1	0	0	0
1	0	1	1
1	1	0	0
0	1	0	0

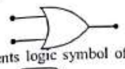
From the above truth table it is clear that $Y = 1$, when $A = 1, B = 0$ and $C = 1$

20. **(a)** : Current gain, $\beta = \frac{\Delta I_C}{\Delta I_B}$

$$= \frac{(20 - 10)\text{ mA}}{(300 - 100)\,\mu\text{A}} = \frac{10 \times 10^{-3}\text{ A}}{200 \times 10^{-6}\text{ A}} = 50$$

21. **(d)** :In forward biasing, the positive terminal of the battery is connected to p-side and the negative terminal to n-side of p-n junction. The forward bias voltage opposes the potential barrier. Due to it, the depletion region becomes thin.

22. **(d)** : (i)

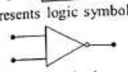


It represents logic symbol of OR gate.

(ii)

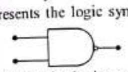
It represents logic symbol of AND gate.

(iii)



It represents the logic symbol of NOT gate.

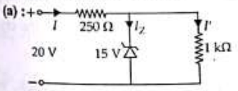
(iv)



It represents the logic symbol of NAND gate.

23. **(c)** :When a small amount of antimony (pentavalent) is added to germanium (tetravalent) crystal, then crystal becomes n-type semiconductor. In n-type semiconductor electrons are the majority charge carriers and the holes are the minority charge carriers.

24. **(a)** :



The voltage drop across $1\text{ k}\Omega = V_Z = 15\text{ V}$
The current through $1\text{ k}\Omega$ is

$$I' = \frac{15\text{ V}}{1 \times 10^3\,\Omega} = 15 \times 10^{-3}\text{ A} = 15\text{ mA}$$

The voltage drop across $250\,\Omega = 20\text{ V} - 15\text{ V}$
The current through $250\,\Omega$ is

$$I = \frac{5\text{ V}}{250\,\Omega} = 0.02\text{ A} = 20\text{ mA} = 5\text{ V}$$

The current through the zener diode is
$I_Z = I - I' = (20 - 15)\text{mA} = 5\text{ mA}$

25. **(c)** : p-n junction is said to be forward biased when p side is at high potential than n side. It is for circuit (A) and (C).

26. **(a)** :p-type semiconductor is obtained when Si or Ge is doped with a trivalent impurity like aluminium (Al), boron (B), indium (In) etc,
Here, $n_i = 1.5 \times 10^{16}\text{ m}^{-3}$

$n_h = 4.5 \times 10^{22}\text{ m}^{-3}$

As $n_e n_h = n_i^2$

$$n_e = \frac{n_i^2}{n_h} = \frac{(1.5 \times 10^{16}\text{ m}^{-3})^2}{4.5 \times 10^{22}\text{ m}^{-3}} = 5 \times 10^9\text{ m}^{-3}$$

27. **(b)** : In a n-type semiconductors, electrons are majority carriers and holes are minority carriers.

28. **(a)**

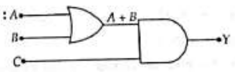
29. **(b)** : The device that can act as a complete circuit is integrated circuit (IC).

30. **(c)** : Here,
Voltage gain = 50
Input resistance, $R_i = 100\,\Omega$
Output resistance, $R_o = 200\,\Omega$

$$\text{Resistance gain} = \frac{R_o}{R_i} = \frac{200\,\Omega}{100\,\Omega} = 2$$

$$\text{Power gain} = \frac{(\text{Voltage gain})^2}{\text{Resistance gain}} = \frac{50 \times 50}{2} = 1250$$

31. **(c)** :



The Boolean expression of the given circuit is

$$Y = (A + B)\cdot C$$

The table truth of the given input signals as shown in the table

A	B	C	$A + B$	$Y = (A + B)\cdot C$
0	1	0	1	0
0	0	1	0	0
1	0	1	1	1
1	0	0	1	0

From the table truth we conclude that output $Y = 1$, for the inputs $A = 1, B = 0, C = 1$.
Hence option (c) is correct.

32. **(d)** : It is clear from given logic circuit, that out put Y is low when both the inputs are high, otherwise it is high. Thus logic circuit is NAND gate.

A	B	Y
1	1	0
0	0	1
0	1	1
1	0	1

33. **(c)**

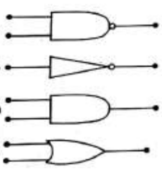
34. **(c)** : Band gap = 2.5 eV

The wavelength corresponding to 2.5 eV

$$= \frac{12400 \text{ eV Å}}{2.5 \text{ eV}} = 4960 \text{Å}.$$

4000 Å can excite this.

35. **(b)** : (i), (ii), (iii), (iv)



OR gate, NOT gate and NAND gates are (iv), (ii) and (i) respectively.

36. **(c)** : For common emitter, the current gain is

$$\beta = \left(\frac{\Delta I_C}{\Delta I_B}\right)_{V_{CE}}$$

i.e., at a given potential difference of CE

$$\beta = \frac{(10 \times 10^{-3} - 5 \times 10^{-3}) \text{ A}}{(200 \times 10^{-6} - 100 \times 10^{-6}) \text{ A}} = \frac{5 \times 10^{-3}}{100 \times 10^{-6}}$$

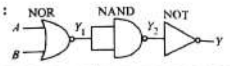
$= 50.$

37. **(a)** : Distance between nearest atoms in body centred cubic lattice (bcc), $d = \frac{\sqrt{3}}{2} a$

Given $d = 3.7$ Å,

$$a = \frac{3.7 \times 2}{\sqrt{3}} = 4.3 \text{ Å}$$

38. **(a)** :



NOR			NAND			NOT
A	B	Y_1	Y_1	Y_1	Y_2	Y
			A	B		
0	0	1	1	1	0	1
0	1	0	0	0	1	0
1	0	0	0	0	1	0
1	1	0	0	0	1	0

Same as NOR Gate

NOR Gate

0	0	1
0	1	0
1	0	0
1	1	0

39. **(d)** : Band gap = 2 eV.

Wavelength of radiation corresponding to this energy,

$$\lambda = \frac{hc}{E} = \frac{12400 \text{ eV Å}}{2 \text{ eV}} = 6200 \text{ Å}$$

The frequency of this radiation

$$= \frac{c}{\lambda} = \frac{3 \times 10^8 \text{ m/s}}{6200 \times 10^{-10} \text{ m/s}}$$

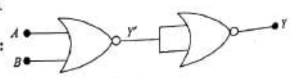
$\Rightarrow \upsilon = 5 \times 10^{14}$ Hz.

40. **(b)** : The atomic radius in a f.c.c. crystal is $\frac{a}{2\sqrt{2}}$ where a is the length of the edge of the crystal.

$\therefore$ Atomic radius $= \frac{3.6 \text{ Å}}{2\sqrt{2}} = 1.27$ Å

41. **(b)** : One applies negative feed-back, which reduces the output but makes it very stable. For voltage amplification amplifiers the value of output voltage without the negative feed-back could be very high. The value max shown here is 100.

42. **(c)** :



$Y' = \overline{A+B}\cdot \quad Y = \overline{\overline{A+B}} = A+B.$

Truth table of the given circuit is given by

A	B	Y'	Y
0	0	1	0
0	1	0	1
1	0	0	1
1	1	0	1

43. **(*)** : Option not provided. Given : Voltage gain $\beta = 50$

Output resistance $R_o = 200\ \Omega$; Input resistance $R_i = 100\ \Omega$

Power gain $= \beta^2 \times \frac{R_o}{R_i} = (50)^2 \times \frac{200}{100} = 5000.$

44. **(c)** : In a cubic crystal structure $a = b = c, \alpha = \beta = \gamma = 90°$.

45. **(d)** : p-type semiconductor.

46. **(a)** : A diode is said to be forward biased if p-type semiconductor of p-n junction is at high potential with respect to n-type semiconductor of p-n junction. It is so for circuit (a).

47. **(b)** : The truth table corresponding to waveform is given by

A	B	C
1	1	1
0	1	0
1	0	0
0	0	0

$\therefore$ The given logic circuit gate is AND gate.

48. **(d)** : Current gain, $\beta = \Delta I_C / \Delta I_B$

$$= \frac{(10-5) \text{ mA}}{(150-100)\ \mu\text{A}} = \frac{5 \times 10^{-3}}{50 \times 10^{-6}} = 100.$$

49. **(c)** : Resistivity of a semiconductor decreases with increase in the temperature.

50. **(c)** : Zener diode is used for stabilisation while p-n junction diode is used for rectification.

51. **(d)**

52. **(a)** : Band gap of carbon is 5.5 eV while that of silicon is 1.1 eV.

$(E_g)_C > (E_g)_{Si}$

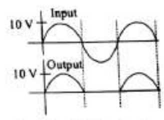
53. **(b)** : Lattice constant for (f.c.c.)

$= a =$ interatomic spacing $\times \sqrt{2} = 3.59$ Å.

54. **(b)** : In photocell, photoelectromotive force, is the force that stimulates the emission of an electric current when photovoltaic action creates a potential difference between two points and the electric current depends on the intensity of incident light.

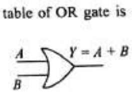
55. **(a)** : In semiconductors at room temperature the electrons get enough energy so that they are able to over come the forbidden gap. Thus at room temperature the valence band is partially empty and conduction band is partially filled. Conduction band in semiconductor is completely empty only at 0 K.

56. **(b)** : $V_{dc} = \frac{V_m}{\pi} = \frac{10}{\pi}$.



57. **(b)** : The truth table of OR gate is

A	B	Y
0	0	0
0	1	1
1	0	1
1	1	1



From truth table we can observe that if either of input is one then output is one. Also if both the inputs are one then also output is one.

58. **(c)** : A diode is said to be reverse biased if p-type semiconductor of p-n junction is at low potential with respect to n-type semiconductor of p-n junction. It is so for circuit (c).

59. **(b)** : In reverse biasing, the conduction across the p-n junction takes place due to minority carriers, therefore the size of depletion region (potential barrier) rises.

60. **(b)** : A n-p-n transistor conducts when emitter-base junction is forward biased while collector-base junction is reverse biased.

61. **(d)** : In full wave rectifier the fundamental frequency in ripple is twice of input frequency.

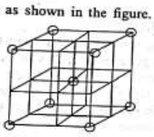
62. **(a)** : Barrier potential depends upon temperature doping density and forward biasing.

63. **(a)** :

$Y' = \overline{A \cdot B}$ and

$Y = \overline{\overline{A \cdot B}} = A \cdot B.$

64. **(c)** : In body-centred cubic (b.c.c.) lattice there a eight atoms at the corners of the cube and one the centre as shown in the figure.



b.c.c. structure

Therefore number of atom per unit cell $= \frac{1}{8} \times 8 + 1 = 2$.

65. **(d)** : The current gain of a common emitter transistor (β) is defined as the ratio of collector current (I_C) to the base current (I_B).

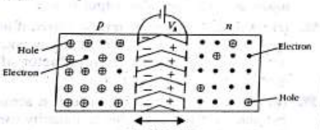
Also, $I_E = I_B + I_C$; $I_C/I_E = 0.96$ (given)

$$\therefore \beta = \frac{I_C}{I_B} = \frac{I_C}{I_E - I_C}$$

Now, $\frac{I_E}{I_C} = \frac{1}{0.96}$. $\therefore \frac{I_E - I_C}{I_C} = \frac{1}{0.96} - 1 = \frac{0.04}{0.96}$

$$\therefore \beta = \frac{I_C}{I_E - I_C} = \frac{0.96}{0.04} = 24.$$

66. **(a)** :



Depletion layer

A p-n junction is shown in the figure. On account of difference in concentration of charge carriers in the two sections of p-n junction, the electrons from n-region diffuse through the junction into p-region and the holes from p-region diffuse into n region. Since the hole is a vacancy of an electron, when an electron from n region diffuses into the p-region, the electron falls into the vacancy, *i.e.* it completes the covalent bond. Due to migration of charge carriers across the junction, the n-region of the junction will have its electrons neutralized by holes from the p-region, leaving only ionised donor atoms (positive charges) which are bound and cannot move. Similarly, the p region of the junction will have ionised acceptor atoms (negative charges) which are immobile.

The accumulation of electric charges of opposite polarities in the two regions of the junction gives rise to an electric field between these regions as if a fictitious battery is connected across the junction with its positive terminal connected to n region and negative terminal connected to p region. Therefore, in a p-n junction high potential is at N side and low potential is at P side.

67. **(a)** : NAND gate is a combination of AND and NOT gate.

AND gate

A	B	Y
0	0	0
1	0	0
0	1	0
1	1	1

Truth table of AND gate

NOT gate

A	Y
0	1
1	0

Truth table of NOT gate

NAND gate

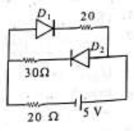
A	B	Y
0	0	1
1	0	1
0	1	1
1	1	0

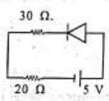
Truth table of NAND gate

Hence the given truth table is of a NAND gate.

68. **(a)** : In forward biasing, the resistance of p-n junction diode is very low to the flow of current. So practically all the voltage will be dropped across the resistance R, *i.e.* voltage across R will be V. In reverse biasing, the resistance of p-n junction diode is very high. So the voltage drop across R is zero.

69. (b) : $D_1 \rightarrow$ reverse biased & $D_2 \rightarrow$ forward biased.
Equivalent circuit is





$$I = \frac{5\text{ V}}{(30+20)\,\Omega} = \frac{5}{50}\text{ A.}$$

70. **(a)** : $\frac{I_C}{I_E} = \alpha = 0.98$, $\frac{I_C}{I_B} = \beta = \frac{\alpha}{1-\alpha} = 49$

71. **(b)**

72. **(a)** : A diode is said to be forward biased if p-type semiconductor of p-n junction is at positive potential with respect to n-type semiconductor of p-n junction. It is so for circuit (a).

73. **(b)** : $\beta = \frac{I_c}{I_b} = \frac{I_c}{I_e - I_c} = \frac{I_c/I_e}{1-(I_c/I_e)} = \frac{\alpha}{1-\alpha}$.

74. **(d)** : As a p - n junction diode conducts in forward bias and does not conduct in reverse bias (current is practically zero), thus undirectional property leads to application of diode in rectifiers.

75. **(a)** : Atomic radius for body centered cubic structure is $r = \frac{a\sqrt{3}}{4}$

or, $a = \frac{4r}{\sqrt{3}} = \frac{4(3.7/2)}{1.732} = 4.3$ Å.

76. **(c)**

77. **(b)** : In forward biasing, the conduction across p-n junction takes place due to migrations of majority carriers (*i.e.* electrons from n-side to p-side and holes from p-side to n-side), hence the size of depletion region decreases.

78. **(d)**

79. **(d)**

80. **(c)** : Because P (phosphorus) is pentavalent.

81. **(d)**

82. **(a)**

83. **(d)** : $I_b = \frac{V_{in}}{R_{in}} = \frac{0.01}{10^3}$

$I_c = \beta I_b = 50 \times \frac{0.01}{10^3} = 5 \times 10^{-4}\text{ A} = 500\ \mu\text{A}$.

84. **(c)** : On reversing the polarity of the battery, the p-n junction is reverse biased. As a result of which its resistance becomes high and current through the junction drops to almost zero.

85. **(c)** : Voltage drop across diode (V_D) = 0.5 V;
Maximum power rating of diode (P) = 100 mW $= 100 \times 10^{-3}$ W
and source voltage (V_s) = 1.5 V.
The resistance of diode (R_D)

$$= \frac{V_D^2}{P} = \frac{(0.5)^2}{100 \times 10^{-3}} = 2.5\ \Omega.$$

And current in diode (I_D) $= \frac{V_D}{R_D} = \frac{0.5}{2.5} = 0.2\ \Omega$.

Therefore total resistance in circuit (R)

$$= \frac{V_s}{I_D} = \frac{1.5}{0.2} = 7.5\ \Omega.$$

And the value of the series resistor = Total resistance of the circuit – Resistance of diode $= 7.5 - 2.5 = 5\ \Omega$.

86. **(a)** : Current gain (β) $= \frac{\alpha}{1-\alpha}$ or $\beta - \beta\alpha = \alpha$

or, $\beta = \alpha + \beta\alpha = \alpha(1+\beta)$ or $\alpha = \frac{\beta}{1+\beta}$.

87. **(b)** : For NOR gate, $Y = \overline{A+B}$. Therefore from the given truth table

A	B	$A+B$	$Y = \overline{A+B}$
1	1	1	0
1	0	1	0
0	1	1	0
0	0	0	1

88. **(a)** : In p type germanium semiconductor, it must be doped with a trivalent impurity atom. Since indium is a third group member, therefore germanium must be doped in indium.

89. **(c)** : In n-p-n transistor, the electrons are majority carriers in emitter, which move from base to collector while using n-p-n transistor as an amplifier.

90. **(b)** : Arsenic is pentavalent, therefore when added with silicon it leaves one electron as a free electron. In this case the conduction of electricity is due to motion of electrons, so the resulting material is n-type semiconductor.

91. **(b)**

92. **(c)** : According to figure $Y = \overline{A \cdot B}$. Therefore it is NAND gate.

93. **(c)** : $a = 4.225$ Å

For BCC cubic cell, $4r = \sqrt{3} \times a$.

Therefore $2r = \frac{\sqrt{3} \times a}{2} = \frac{1.732 \times 4.225}{2} = 3.66$ Å.

94. **(b)** : As soon as the p-n junction is formed, there is an immediate diffusion of the charge carrier across the junction due to thermal agitation. After diffusion, these charge carriers combine with their counterparts and neutralise each other. Therefore correct direction of flow carriers is depicted in figure (b).

95. **(b)** : Diamond is very hard due to large cohesive energy.

96. **(a) :** The function of emitter is to supply the majority carriers. So, it is heavily doped.

97. **(c) :** van der Waals bonding is the weakest bonding in solids.

98. **(b) :** The amplifying action of a triode is based on the fact that a small change in grid voltage causes a large change in plate current. The AC input signal which is to be amplified is superimposed on the grid potential.

99. **(a) :** According to Child's Law,

$I = KV^{3/2}$

Thus $I \propto V^{3/2}$

100. **(d) :** Copper is a conductor so its resistance decreases on decreasing temperature as thermal agitation decreases whereas germanium is semiconductor which on decreasing temperature resistance increases.

101. **(b) :** The depletion layer in the *p-n* junction region is caused by diffusion of charge carriers.

102. **(b) :** This truth table is of identity, $Y = A + B$, hence OR gate.

103. **(a) :** To use transistor as an amplifier the emitter base junction is forward bias while the collector base junction is reverse biased.

104. **(a) :** The phase difference between output voltage and input signal voltage in common base transistor or circuit is zero.

105. **(b) :** Voltage gain of an amplifier

$$= \frac{\text{Output voltage}}{\text{Input voltage}} = -\frac{\mu R_L}{R_L + r_P}$$

The negative sign indicates that the output voltage differs in phase from the input voltage by $180°(\pi)$. This holds for a pure resistive load.

106. **(d) :** Due to heating, when a free electron is produced than simultaneously a hole is also produced.

107. **(d) :** Radiowaves of constant amplitude can be produced by using oscillator with proper feedback.

108. **(a) :** For forward biasing of *p-n* junction, the positive terminal of external battery is to be connected to *p* semiconductor and negative terminal of battery to the *n* semiconductor.

109. **(c) :** Semiconductors are insulators at room temperature.
